INTRODUCTION

This document presents the Annual Groundwater Monitoring Report for HWMU-7 for calendar year 2001, which was compiled in accordance with the requirements of the Post-Closure Permit for HWMU-7 dated September 30, 1999. The Annual Groundwater Monitoring Report presents the following set of information for HWMU-7: basic information and unit identification, a description of the groundwater monitoring plan, a discussion of groundwater movement, an updated potentiometric map, a table of groundwater elevations and detailed statistical evaluations of the analytical data. The report evaluates the analytical data from the four quarterly sampling events for the year 2001. The laboratory analytical results for the year 2001 are included in **Appendix A**.

As specified in the Post-Closure Permit, the compliance monitoring network for HWMU-7 consists of eight monitoring wells: one upgradient well (7W12B), three point of compliance wells (7WCA, 7W11, and 7W11B), and four additional sampling wells (7W9C, 7W10B, 7W10C, and 7W13). AAPC has been unable to obtain a sample from well 7W11 for several years due to lack of groundwater in the well. Therefore, AAPC sampled well 7MW6 as an alternate point of compliance well to replace well 7W11.

As stated in the Post-Closure Permit, the Compliance Period during which the Ground Water Protection Standard applies to HWMU-7 is 18 years, beginning on the effective date of the Post-Closure Permit (September 30, 1999). The Compliance Period shall continue until September 30, 2017. This report is the second complete Annual Groundwater Monitoring Report submitted to the VDEQ for this Unit during the Compliance Period.

HWMU-7 ANNUAL GROUNDWATER MONITORING REPORT

- **CALENDAR YEAR:** 2001
- **REPORT DATE:** March 1, 2002

Prepared for the Virginia Department of Environmental Quality - Waste Division (VDEQ-WD) in accordance with the requirements of the Post-Closure Permit for HWMU-7 dated September 30, 1999.

A. WASTE MANAGEMENT UNIT INFORMATION

- **UNIT NAME:** Hazardous Waste Management Unit 7 (HWMU-7)
- **OWNER/OPERATOR:** United States Army / Alliant Ammunition and Powder Company, L.L.C.
- **UNIT LOCATION:** Radford AAP Main Plant Area, Radford, Virginia
- **CLASS:** Hazardous Waste Management Unit
- **TYPE:** Closed Holding and Neutralization Basin

B. GROUNDWATER MONITORING PLAN

- **MONITORING NETWORK**
 - UPGRADIENT WELL: 7W12B
 - POINT OF COMPLIANCE WELLS: 7WCA, 7W11B, 7W11 (replaced by 7MW6)
 - ADDITIONAL SAMPLING WELLS: 7W9C, 7W10B, 7W10C, 7W13
 - OBSERVATION WELLS: 7MW5, 7W9B
(static water level measurements only)
- **MONITORING STATUS:** Compliance Monitoring Program
- **DATA COLLECTION STATUS:**
 - Quarterly Event February 28, 2001
 - Quarterly Event May 23-24, 2001 (Annual 40 CFR 264 Appendix IX monitoring)
 - Quarterly Event July 24-25, 2001
 - Quarterly Event October 30-31, 2001

C. GROUNDWATER MOVEMENT

The monitoring wells at HWMU-7 are screened entirely within either alluvium, weathered carbonate bedrock residuum or carbonate bedrock, or across the interfaces between two of the listed strata. The static water level measurements gathered during the 2001 quarterly

monitoring events are summarized in **Table 1**. Groundwater fluctuations did not appear to exceed 1 to 2 feet annually, although individual wells tapping karst conduits could have experienced dramatic fluctuations following storm events. As shown on the HWMU-7 Potentiometric Surface Maps, groundwater movement beneath the site is generally to the west towards the New River and to the northeast and southwest toward the unnamed intermittent drainages that flow into the New River north and south of the site.

Darcian flow conditions were assumed for the alluvium, residuum, and karst carbonate bedrock beneath HWMU-7. As a result, the groundwater velocities were calculated by multiplying the hydraulic conductivity (determined from previously conducted slug tests) by the average hydraulic gradient across the site, and dividing by an assumed effective porosity for the aquifer materials. The average hydraulic gradient was determined by superimposing three evenly spaced flow line vectors over the Potentiometric Surface Map, measuring their lengths, calculating the head differential over the distances measured, and dividing the head differential by the length of the flow line vectors. The three calculated gradients were then averaged to a single value. Using this method, the average groundwater hydraulic gradient across the site based on the Fourth Quarter 2001 groundwater elevations was calculated to be 0.020 ft/ft. Historical slug test data for the site yielded an average hydraulic conductivity of 5.1×10^{-6} ft/second. This value is consistent with literature values for karst carbonate rock and for clayey, silty sand and gravel alluvium and residuum (Domenico and Schwartz, 1990).

The estimated groundwater velocity across the site was calculated to be approximately 2.20×10^{-2} ft/day or 8.0 ft/year, based on the following:

- an average hydraulic conductivity of 5.1×10^{-6} ft/second;
- an average hydraulic gradient of 0.020 ft/ft; and
- an assumed effective porosity of 0.40, based on a representative range of porosities for karst carbonate rock, weathered residuum, and clayey, silty sand and gravel alluvium (Domenico and Schwartz, 1990).

The actual groundwater flow velocities in the carbonate bedrock may vary as much as one to two orders of magnitude from the velocity presented above, depending on water level conditions and the distribution of karst conduits.

D. STATISTICAL EVALUATIONS

The analytical results for each Year 2001 quarterly event are summarized in **Table 2** along with the groundwater protection standards. The groundwater samples collected from the compliance monitoring network during the Year 2001 quarterly monitoring events were analyzed for the constituents listed in Attachment 10 of the Post-Closure Permit. In accordance with Part V Section H of the Post-Closure Permit, a non-statistical point comparison was used to compare the groundwater monitoring data for each quarter with the groundwater protection standards specified in Permit Attachment 14. The results of the non-statistical point comparison indicated that the concentrations of constituents detected during each Year 2001 quarterly monitoring event were all below their respective groundwater protection standards. As stipulated under Part

V Section H of the Post-Closure Permit and Section 7.2 of Permit Attachment 12, the non-statistical point comparison method was selected due to the fact that all of the groundwater protection standards specified in Permit Attachment 14 are based on fixed standards rather than background monitoring data.

In accordance with the requirements of Part V Section J.2 of the Post-Closure Permit, the established background values and the computations used to determine the background values are included in **Appendix B**. The background values and associated computations are taken from the Groundwater Quality Assessment Report for HWMU-7 prepared by Environmental Resources Management dated August 24, 1998.

E. ADDITIONAL ISSUES

During the Second Quarter 2000 monitoring event (May 1, 2000), three constituents listed in Appendix IX of 40 CFR 264 (beryllium, cobalt, and copper) were detected in the samples collected from point of compliance wells 7WCA and 7W11B. These three constituents are not included in the current monitoring list for HWMU-7. By the time the analytical data for the Second Quarter 2000 event had been received and evaluated, AAPC had already completed the Third Quarter 2000 monitoring event for HWMU-7. Therefore, confirmation analyses for the presence of beryllium, cobalt, and copper could not be conducted during the Third Quarter 2000 event. As stipulated in Part V Section I.5 of the Post-Closure Permit, AAPC planned to resample the point of compliance wells for the three constituents (beryllium, cobalt, and copper) to confirm their presence during the Fourth Quarter 2000 monitoring event. However, due to laboratory coordination efforts, the sampling for the detected Appendix IX constituents was inadvertently overlooked. As a result, AAPC collected samples for these three constituents in addition to the regular constituents specified in the groundwater monitoring list for the Unit during the First Quarter 2001 (February 28, 2001) monitoring event.

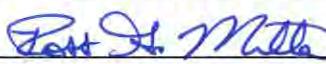

The analytical data for the First Quarter 2001 monitoring event confirmed the presence of cobalt only in point of compliance well 7WCA. Concentrations of beryllium and copper were not detected in any of the point of compliance wells. Following receipt of the First Quarter 2001 analytical results, AAPC notified the VDEQ and cobalt was added to the groundwater monitoring list for the Unit. During subsequent monitoring events, cobalt was only detected during the Fourth Quarter 2001 event in the sample collected from point of compliance well 7WCA (**Table 2**).

The analytical results from the annual 40 CFR 264 Appendix IX monitoring event conducted during Second Quarter 2001 (May 23-24, 2001) indicated that no concentrations of additional Appendix IX constituents were detected in the groundwater samples collected from the point of compliance wells.

APPENDIX B

**ESTABLISHED BACKGROUND VALUES AND COMPUTATIONS FOR HWMU-7
FROM
GROUNDWATER QUALITY ASSESSMENT REPORT – HWMU-7
ENVIRONMENTAL RESOURCES MANAGEMENT
AUGUST 24, 1998**

April 1995 letter from the DEQ to J. Redder, Hercules, Inc. (now Alliant TechSystems, Inc.). The lists incorporate requirements outlined in the Virginia Hazardous Waste Management Regulations (VR 672-10-1) Sections 9.5.C and 9.5.D. These include the Indicator Parameters, Ground Water Quality Parameters, EPA Interim Primary Drinking Water Standards, Known Hazardous Waste Constituents, and Detected VHWMR Appendix 10.6 Constituents. A demonstration was made to the DEQ that several hazardous waste constituents had not been detected for six consecutive quarters. As a result, these constituents have not been analyzed for on a regular basis. These are highlighted in the Table 3-1.

Additional parameters have not been detected in any of the wells. During the meeting between Alliant and DEQ on 21 May 1996, DEQ suggested that the recommendations to temporarily cease sampling additional constituents that had not been detected in six or more consecutive sampling events made in the GWQAP addendum submitted 3 November 1995 would better be addressed in the post closure permitting process. Therefore, those additional constituents will not be addressed in this report.

3.4

UNIT 7 GROUND WATER BACKGROUND VALUES

As requested in the DEQ's 23 July letter, background values were calculated for each parameter .

As discussed with DEQ, Alliant believes the analytical data to be questionable in some cases. DEQ has agreed in a 9 April 1996 letter to C. Jake (Alliant) that only total metals will be measured, as described in an EPA Region III guidance on ground water sampling in karst terrain. Another case of questionable data involves an increase in Total Organic Carbon (TOC) concentrations by a factor of 10. As such, the TOC concentrations from 1995 through 1997 were used to calculate the background values. Table 3-2 presents the *Historical Maximum Values*, which were used to develop the isocontour maps.

As requested in the DEQ's 23 July 1998 letter, using the data from well 7W12B, background values were calculated for each parameter in the ground water monitoring program. However, as a result of the 21 May 1996 meeting and subsequent telephone conversations, these background values are being submitted in accordance with the regulations and shown on the isocontour maps but were not utilized for purposes of this report.

Additionally, calculations of background values based on the 95% confidence, 95% coverage upper tolerance limit require that data distributions be normal or lognormal. Some of the data do not fulfill this requirement

3.5

UNIT 7 STATISTICAL ANALYSIS

Statistical evaluations for Unit 7 are performed annually and submitted as part of the Annual Reporting requirements found in the VHWMR Section 9.5. As a result of the 21 May 1996 meeting between Alliant and DEQ, Alliant has established background ground water concentrations for the upgradient well, 7W12B utilizing the Virginia DEQ "*Guidance on Statistical Methods for Ground Water Data Analysis at a Solid Waste or Hazardous Waste Site, Version 2.0, 1995*". In response to Mr. Glenn von Gonten's letter dated 23 July, 1998, Alliant has revised the background concentrations to include sample data collected in 1997. These values can be found in **Table 3-3**. Methods used for background concentration computation and statistical analysis are described below.

The following parameters were 100% Non-Detected in 20 or more sampling events. The downgradient well data points were compared to the laboratory PQLs in a nonparametric statistical manner or to the applicable MCL or VGWPS (if one exists). Background values were then estimated by using the laboratory PQL for that constituent.

<i>Parameter</i>	<i>PQL</i> (<i>ppb</i>)	<i>Sample Size</i>	<i>% Non-Detect</i>	<i>MCL or VGWPS</i> (<i>ppb</i>)
2,4-DNT	0.2	22	100	None
2,6-DNT	0.1	22	100	None
2,4 Dinitrophenol	11	11	100	None
Benzyl Alcohol	8	8	100	None
Cyanide	20	20	100	5
Bis(2- ethyl hexyl) phthalate	9	9	100	None
2 - Nitrophenol	9	9	100	None
4 - Nitrophenol	9	9	100	None
Acetone	100	14	100	None
Antimony	30	14	100	None
Vanadium	40	20	100	None

The following parameter has log-normally distributed data with between 15 and 50 percent Non-Detect values. As such, Cohen's Method was used as an adjustment for the mean and standard deviation, as recommended in the DEQ guidance. Results of the background analysis are summarized in Table 3-4

<i>Parameter</i>	<i>Sample Size</i>	<i>% Non-Detect</i>
Lead	23	34

The following parameters have data with greater than 50% Non-Detects, a minimum sample size of twenty (20). The data were non-normally distributed as indicated using a data distribution statistical method. According to Mr. Glenn von Gonten, DEQ in a 30 July 1996 telephone conversation, the maximum value detected will be used for plume delineation purposes for those constituents with greater than 50% non-detected values. An isocontour map for Total Organic Halides could not

be created because only one sampling point maximum concentration exceeded the background value.

Parameter	Sample Size	% Non-Detect
Arsenic	23	91.3
Cadmium	23	60.9
Chromium	23	56.5
Cobalt	20	65.5
Mercury	23	82.6
Nickel	20	85
Selenium	23	82.6
Thallium	20	70
Total Organic Halides	48	62.5

The following parameters do not have greater than four (4) sampling events and therefore could not be included in this (plume) evaluation:

- 2,4-D
- Gross Beta
- Radium
- Sulfate

The following parameters have between 15 and 50 percent Non-Detect values, and do not have normal or log-normal data distributions. Thus, Cohen's Method could not be used. Per the DEQ's 23 July letter, background concentrations were computed by calculating an upper tolerance limit based on 95% coverage, at a 95% confidence level. It should be noted that upper tolerance limits are not typically used unless the data are normally or log-normally distributed. Background concentration analysis data is summarized in Table 3-4.

<i>Parameter</i>	<i>Sample Size</i>	<i>% Non-Detects</i>
Total Organic Carbon	36	27.2%
Silver	23	47.8%

The remaining parameters have less than 15% Non-Detect values and no data manipulation was required. Computation data for barium, copper, specific conductivity, and zinc are summarized in Table 3-4

<i>Parameter</i>	<i>Sample Size</i>	<i>% Non-Detect</i>
Copper	20	0
PH	92	0
Barium	23	13
Specific Conductivity	92	0
Zinc	20	0

*Table 3-3
Unit 7
Background Values*

<i>Parameter</i>	<i>Units</i>	<i>Background Value</i>
