Data Validation Report

SW-846 INORGANIC DATA REVIEW SUMMARY

Draper Aden Associates performed a comprehensive manual review of the analytical results for the April 13-14, 2009 semiannual groundwater monitoring event at the Open Burning Ground (HWMU 13) located at the Radford Facility Army Ammunition Plant (RFAAP), in Radford, Virginia.

Draper Aden Associates, of Blacksburg, Virginia, collected groundwater samples from monitoring wells 13MW1, 13MW2, 13MW3, 13MW4, 13MW5, 13MW6 and 13MW7. Sample 13MWDUP, a blind field duplicate for 13MW4, was also submitted for analysis.

CompuChem, a Division of Liberty Analytical, (CompuChem), of Cary, North Carolina, performed the analyses. For this Appendix IX monitoring event, samples 13MW3, 13MW4, 13MW5, 13MW6 and 13MW7 were analyzed for Appendix IX inorganic target analytes, including cyanide and sulfide. Samples 13MW1 and 13MW2, background monitoring wells for the facility, were analyzed only for the 11 permit required inorganic target analytes. The following information and attached table summarizes the inorganic data review results.

Inductively Coupled Plasma Atomic Emission Spectroscopy/Mass Spectrometry (ICP-MS) and Cold Vapor Atomic Absorption (CVAA) were the techniques used for the metal analysis. ICP-MS Method 6020 was used to analyze for antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, nickel, selenium, silver, thallium, tin, vanadium and zinc. For 13MW1 and 13MW3, the two background wells, antimony, arsenic, barium, cadmium, chromium, lead, nickel, selenium, silver, and zinc were reported by Method 6020. All samples were analyzed for mercury by CVAAS SW-846 Method 7470A. Method 9012A was used to analyze for cyanide and Method 9034 was used to analyze for sulfide. All target analytes were analyzed for total (T) concentrations.

On behalf of RAAP, CompuChem submitted results to Draper Aden Associates in a final certificate of analysis which included sample analytical results as well as relevant documentation to verify and validate the results.

The evaluation of CompuChem's compliance with the method and validation of results presented here are based upon a limited review of QA/QC information including holding times, preservation procedures, instrument tuning, calibration and calibration verification data, QL standards, blank samples (method, calibration, and other blanks), interference check sample, pre-digestion matrix spike and matrix spike duplicate (MS/MSD), laboratory control sample (LCS), internal standard, and serial dilution results, where applicable. A review of transcriptions from instrument data to sample summary sheets was performed. Calculation checks were performed on a minimum ten percent of the data set. The following information is intended to summarize data review results and any observed significant deviations from method and/or contractual requirements.

CompuChem received the samples on ice and in good condition, with custody seals intact. The chain of custody was appropriately signed and dated by field and laboratory personnel. Applicable holding time and preservation criteria were met for all samples except sulfide discussed below.

Method 6020 (ICP-MS)

The laboratory submitted the results in two separate sample delivery groups. The original certificates of analysis were received on May 21, 2009 (SDG 0904103) and May 28, 2009 (SDG 0904098). The revised certificate of analysis, received June 10, 2009, was complete in its presentation and the data were of acceptable quality. The data set demonstrated the laboratory's ability to achieve the reported permit quantitation limit (QL).

QC history documentation was provided. Applicable instrument tune, calibration and calibration verification requirements were met. QL standards, blank, interference check samples (ICSAB), MS/MSD, LCS, internal standard data, and serial dilution results recovered within control limits, where applicable, except where noted below. Deviations from QA/QC criteria that were noted during the data review are summarized below.

The QL standard concentration for barium was 10 µg/l instead of 1 µg/l. However, acceptable recovery was observed and no data qualification was required.

The MS and MSD (13MW5) recovered low for tin (58%). Tin was not detected above the permit detection limit or QL in any sample and all tin results were qualified as "UJ" to note that the permit detection limit and permit QL are estimated due to the observed QC deviation.

The serial dilution percent difference was greater than 10% (33%) for barium (13MW5). Compliance well results for barium are qualified as estimated "J" due to this observed QC deficiency. The percent difference for the serial dilution check associated with the background wells (13MW1) was within acceptance criteria and barium results for 13MW1 and 13MW2 were not qualified.

Field duplicate/sample results (13MW4) exhibited acceptable precision, where applicable.

The MDL study and analysts initial demonstration of capability data were provided as a revision and submitted with the HWMU5 data package (SDG 0904138).

For this event, the certificates of analysis required revisions to report the correct QLs and DLs for the target analyte metals. As well, Method 6020 data from SDG 0904103 (compliance wells) was not usable due to reported QLs above the project specified QLs. Samples in this SDG were diluted to meet the internal standard relative intensity (RI) requirements. These samples were re-digested and re-analyzed and QC requirements were met.

For this Appendix IX groundwater monitoring event, all sample results were reported at or above the permit detection limit. Target analytes reported by the laboratory as detected less than the corresponding permit QL were validated and qualified as "J" and the reported concentration for should be considered estimated. Sample results unaffected by the data validation process, and not detected at or above the permit detection limit or QL, were validated and reported as "U."

7470A (CVAA)

The original certificate of analysis appeared complete in its presentation and the final data were of acceptable quality. The certificate of analysis demonstrated the ability of the laboratory to achieve the QL for mercury. SDG 0904103 (compliance wells) data was complete for mercury and cyanide, however, the remaining reported results for Method 6020 were revised as noted above.

QC history documentation was provided. Instrument calibration and calibration verification criteria were met. QL, Blank MS/MSD, and LCS results were analyzed as required and all applicable criteria were met unless noted below. Field duplicate/sample results exhibited acceptable precision, where applicable. Calculation checks were performed on a minimum 10 percent of data. A review of transcriptions from instrument data to sample summary sheets was performed. No deviations from QA/QC criteria were noted during data review.

The MDL study and analyst's initial demonstration of capability data were provided as a revision and submitted with the HWMU5 data package (SDG 0904138).

For this Appendix IX groundwater monitoring event, all sample results were reported at or above the permit detection limit. Mercury results reported by the laboratory as detected less than the corresponding permit QL were validated and qualified as "J" and the reported concentration should be considered estimated. Mercury results unaffected by the data validation process, and not detected at or above the permit detection limit or QL, were validated and reported as "U."

For this Appendix IX monitoring event, mercury was not reported at or above the permit detection limit or QL in any sample and all mercury results were validated and reported as "U."

Method 9012A

The original certificate of analysis was received on May 28, 2009. The certificate of analysis was complete in its presentation and the data were of acceptable quality. Documentation was provided to demonstrate the ability of the laboratory to achieve the reported quantitation limit (QL) for cyanide and mercury, however, the remaining reported results for Method 6020 were revised as noted above.

QC deliverables package requirements were met. Instrument calibration and calibration verification criteria were met. Blanks, pre-distillation MS/MSD and LCS samples were analyzed as

required and results were within control limits. The blanks were interference free. Field duplicate/sample results exhibited acceptable precision, where applicable.

The MDL study and analysts initial demonstration of capability data were provided as a revision and submitted with the HWMU5 data package.

For this Appendix IX monitoring event, cyanide results were reported to at or above the detection limit. Cyanide was not detected at or above the detection limit or QL in any sample and all results were validated and reported as "U."

Method 9034

Initial laboratory analytical results for the Appendix IX constituent sulfide indicated that the constituent was not detected in any groundwater sample collected from the point of compliance wells during the Second Quarter 2009 monitoring event. However, the laboratory analyzed the sulfide samples one day outside of the 7-day holding time requirement. Alliant Techsystems Inc. resampled the point of compliance wells for sulfide on June 17, 2009; however, the data for the June 17, 2009 samples were suspect due to laboratory errors. As a result, the VDEQ instructed Alliant to resample the point of compliance wells for sulfide during the upcoming Fourth Quarter 2009 semiannual monitoring event. The results are provided under separate cover.

SW-846 METHOD 8260B VOLATILE ORGANICS DATA REVIEW SUMMARY

Draper Aden Associates performed a comprehensive manual review of the analytical results for the April 13-14, 2009 semiannual groundwater monitoring event at the Open Burning Ground (HWMU13) located at the Radford Facility Army Ammunition Plant (RFAAP), Radford, Virginia. Draper Aden Associates collected groundwater samples from monitoring wells 13MW1, 13MW2, 13MW3, 13MW4, 13MW5, 13MW6 and 13MW7. Groundwater sample 13MWDUP was submitted to the laboratory as a blind field sample duplicate for 13MW4. Samples 13MW3, 13MW4, 13MW5, 13MW6 and 13MW7 were analyzed for Appendix IX volatile target analytes, including the 16 permit required volatile target analytes and samples 13MW1 and 13MW2 were analyzed for only the 16 permit required target analytes by USEPA SW-846 Method 8260B.

Lancaster Laboratories (Lancaster), of Lancaster, Pennsylvania, performed Method 8260B analysis. On behalf of RFAAP, Lancaster submitted results to Draper Aden Associates in a final certificate of analysis that included sample analytical results as well as relevant documentation to validate and verify the results.

The evaluation of Lancaster's compliance with Method 8260B and validation of the results were based on a review of the following items: QC deliverables package, QC history documentation, technical holding times and preservation requirements, instrument performance (tune) check, instrument calibration and calibration verification data, blank samples analyses, surrogate spike recoveries, matrix spike and matrix spike duplicate (MS/MSD) analyses, laboratory control sample (LCS) data, internal standards requirements, and/or target analyte identification and quantitation. A review of transcriptions from instrument data to sample summary sheets was performed. Calculation verifications were performed on a minimum ten percent of the data set. A summary of data review results with observed deviations is provided below.

Lancaster received the samples on ice and in good condition, with custody seals intact. Technical holding times and preservation criteria were met, except where noted. The chain of custody was appropriately signed and dated by field and laboratory personnel.

The original certificate of analysis was received on May 14, 2009. The certificate of analysis was revised June 15, 2009 to include results for the target analyte chloromethane. The revised certificate of analysis was complete in its presentation and the data were of acceptable quality. The certificate of analysis demonstrated the ability of the laboratory to achieve the quantitation limit (QL) for each target analyte, unless noted below.

QC deliverables package requirements were met. Technical holding time and preservation criteria were met, unless noted below. QC history documentation and instrument performance check criteria were met. Initial calibration, calibration verification, blanks, surrogates, MS/MSD,

LCS and internal standards criteria were met, except where noted below. Sample results were verified and no transcription errors were observed.

Technical holding time and sample preservation criteria were met except for acrolein. Acrolein was analyzed using an aliquot adjusted to pH <2. Acrolein results were qualified as "UJ" to note that the analyte was not detected at or above the detection limit (DL) or the QL and the DL and QL were estimated.

Trans-1,4-dichloro-2-butene exceeded the April 22, 2009 continuing calibration verification percent difference/drift requirements. Trans-1,4-dichloro-2-butene was not detected in any sample and results for this target analyte were qualified as "UJ" to note that the DL and QL were estimated due to the observed QC deficiency. Remaining calibration verification criteria were met.

The MS/MSD recovered high (135-150%) for multiple analytes. No data qualification was required for those analytes that were not detected. Chloroform, 1,1,1-trichloroethane, carbon tetrachloride, trichloroethene, and tetrachloroethene recovered high in the MS/MSD and detected analytes were qualified as estimated "J." The LCS recovered within acceptable criteria for these target analytes.

Trichloroethene was reported in 13MW4 at 1.5 µg/l and in the blind field duplicate, 13MWDUP, at 1.5 µg/l and RPD criteria were met.

The laboratory provided the initial demonstration of capability (IDOC) study for analyst A. Sneeringer as a revision to the certificate of analysis.

Trichlorofluoromethane (0.3 J µg/l) and 1,1,1-trichloroethane (0.1 J µg/l) were detected less than the QL in 13MW3 by SW-846 Method 8260B. A verification sampling event was conducted on June 17, 2009 to refute or confirm the reported detection. 1,1,1-Trichloroethane in sample 13MW3 was not detected by Lancaster Laboratories, Lancaster, PA (SDG RAD19 received on July 17, 2009). Trichlorofluoromethane and 1,1,1-trichloroethane in sample 13MW3 were not confirmed by TestAmerica, North Canton, Ohio (Lot # A9F180214 received on July 8, 2009). The verification result for 1,1,1-trichloroethane in sample 13MW3 (Lancaster) was reported as the final result. The verification result for trichlorofluoromethane in sample 13MW3 (TestAmerica) was reported as the final result.

For this Appendix IX monitoring event, results reported to at or above the detection limit. Sample results unaffected by the data validation process and not detected at or above the detection limit were validated and reported as "U." Results reported between the detection limit and QL were qualified as "J" to reflect the estimated concentration. No results were rejected based on the data validation criteria.

SW-846 METHOD 8270C SEMIVOLATILE ORGANIC DATA REVIEW SUMMARY

Draper Aden Associates performed a comprehensive manual review of the analytical results for the April 13-14, 2009 semiannual groundwater monitoring event at the Open Burning Ground (HWMU 13) located at the Radford Facility Army Ammunition Plant (RFAAP), in Radford, Virginia.

Draper Aden Associates collected groundwater samples from monitoring wells 13MW1, 13MW2, 13MW3, 13MW4, 13MW5, 13MW6 and 13MW7. Groundwater sample 13MWDUP was submitted to the laboratory as a blind sample duplicate for 13MW4. Samples 13MW3, 13MW4, 13MW5, 13MW6 and 13MW7 were analyzed for Appendix IX semivolatile target analytes; including the 26 permit required semivolatile target analytes. Samples 13MW1 and 13MW2 were analyzed for only the 26 permit required semivolatile target analytes by USEPA SW-846 Method 8270C.

CompuChem, a division of Liberty Analytical Corporation (CompuChem), of Cary, North Carolina, performed the GC/MS semivolatile analysis. On behalf of RFAAP, CompuChem submitted results to Draper Aden Associates in a final certificate of analysis that included sample analytical results as well as relevant documentation to validate and verify the results.

The evaluation of CompuChem's compliance with Method 8270C and validation of the results was based on a limited review of the following items: QC deliverables package, QC history documentation, case narrative, technical holding time and preservation requirements, instrument performance (tune) check, instrument calibrations, blank analysis, surrogate spike recoveries, matrix spike and matrix spike duplicate (MS/MSD) analyses, laboratory control sample (LCS) data, and internal standard requirements. A review of the transcriptions from instrument data to sample summary sheets was performed. Specific representative calculations on 10% of the data set were performed. The following information is intended to summarize data review results and any observed significant deviations from method and/or contractual requirements.

The original certificate of analysis was received on May 28, 2009. The certificate of analysis for Method 8270C was complete and data were of acceptable quality, except where noted below. The data set demonstrated the laboratory's ability to achieve the required quantitation limit (QL), except where noted below.

The laboratory received the samples on ice and in good condition with custody seals intact. The chain of custody was appropriately signed and dated by field and laboratory personnel. Sample extraction and analysis holding time criteria were met. Sample preservation criteria were met.

QC history documentation (instrument specific initial demonstration of proficiency and method detection limit data) were provided. Technical holding time requirements were met. Instrument performance check (tuning) criteria, initial calibration, calibration verification, blank, MS/MSD, LCS, surrogate recoveries, and internal standard requirements were met, except where

noted below. Sample results were reviewed for transcription errors from the instrument data to the laboratory report and no errors were noted.

Several analytes exceeded the initial calibration relative standard deviation (%RSD) and calibration verification percent drift/difference (%D) requirements and these analytes were qualified as estimated due to the observed QC deficiency (see attached summary table). The laboratory met the initial calibration %RSD using grand mean of all target analytes. Target analytes that exceeded 15% %RSD were qualified as estimated. These target analytes were not detected and the QL was qualified as estimated, "J" due to the observed QC deficiency.

The instrument's initial calibration did not contain hexachlorophene. Hexachlorophene was reported by the laboratory as a tentatively identified compound (TIC). Hexachlorophene was not detected in any sample and hexachlorophene results were qualified as estimated, "UJ" to note that the QL is estimated due to the observed QC deficiency.

Due to analytical limitations, 3-methylphenol and 4-methylphenol cannot be analyzed separately. 3-Methylphenol and 4-methylphenol cannot be resolved under the chromatographic conditions used for sample analysis. The results reported for 3-methylphenol and 4-methylphenol represent the combined total for both compounds.

Kepone and famfur recovered low in the MS and associated results for these analytes were qualified as estimated due to the observed QC deficiency. Hexachloropropene recovered low in the LCS and associated results for this analyte were qualified as estimated due to the observed QC deficiency. Several analytes recovered high in the LCS/MS/MSD; however no data validation was needed. Remaining LCS/MS/MSD criteria were met.

Field duplicate/sample results exhibited acceptable precision, where applicable.

For this Appendix IX monitoring event, results reported to at or above the detection limit. Sample results unaffected by the data validation process and not detected at or above the detection limit were validated and reported as "U." Results reported between the detection limit and QL were qualified as "J" to reflect the estimated concentration.

For this event, no target analytes were detected at or above the detection limit or quantitation limit.

SW-846 METHOD 8280A DIOXIN/FURAN DATA REVIEW SUMMARY

Draper Aden Associates performed a comprehensive manual review of the analytical results for April 13-14, 2009 semiannual groundwater monitoring event at the Open Burning Ground (HWMU 13) located at the Radford Facility Army Ammunition Plant (RFAAP), Radford, Virginia. Draper Aden Associates collected groundwater samples from monitoring wells 13MW1, 13MW2, 13MW3, 13MW4, 13MW5, 13MW6 and 13MW7. Groundwater sample 13MWDUP was submitted to the laboratory as a blind sample duplicate for sample 13MW4. Samples 13MW3, 13MW4, 13MW5, 13MW6 and 13MW7 were analyzed for chlorinated dioxin and furans by USEPA SW-846 Method 8280A. Sample locations 13MW1 and 13MW2 are background wells and analysis was not required. The following information summarizes the Method 8280A data validation results.

TestAmerica West Sacramento, of Sacramento, California, performed the Method 8280A analysis. On behalf of RFAAP, TestAmerica submitted results to Draper Aden Associates in a final certificate of analysis, which included sample analytical results, as well as relevant documentation to validate and verify the results.

The evaluation of TestAmerica's compliance with Method 8280A and validation of the results were based on a review of the following items: QC deliverables package, QC history documentation, technical holding times and preservation requirements, instrument performance (tune) check, instrument calibration and calibration verification data, blank samples analyses, surrogate spike recoveries, matrix spike and matrix spike duplicate (MS/MSD) analyses, laboratory control sample (LCS) data, internal standards requirements, and/or target analyte identification and quantitation. A review of transcriptions from instrument data to sample summary sheets was performed. A summary of data review results and observed deviations is provided below.

The project chain of custody documentation was complete. The laboratory received the samples on ice, in good condition with custody seals intact. The chain of custody was appropriately signed and dated by field and laboratory personnel. Technical holding time and sample preservation criteria were met.

The original certificate of analysis was received on May 7, 2009 and was complete in its presentation and the data were of acceptable quality, except where noted below. The certificate of analysis demonstrated the ability of the laboratory to achieve the permit required quantitation limit (QL) for each target analyte.

QC deliverables package requirements were met. QC history documentation and instrument performance check criteria were met. Initial calibration, calibration verification, blanks, surrogates, MS/MSD, LCS and internal standards criteria were met, except where noted below. Sample results were verified and no transcription errors were observed. The IDOCs are on file with the laboratory and no data qualification was required. Sample results unaffected by the data validation process, and not detected at or above the detection limit and/or QL, were validated and reported as "U." No detections were reported above the detection limit (DL).

SW-846 METHODS 8081A DATA VALIDATION SUMMARY

Draper Aden Associates performed a comprehensive manual review of the analytical results for the April 13-14, 2009 semiannual groundwater monitoring event at the Open Burning Ground (HWMU 13) located at the Radford Facility Army Ammunition Plant (RFAAP), in Radford, Virginia.

Draper Aden Associates, of Blacksburg, Virginia, collected groundwater samples from monitoring wells 13MW1, 13MW2, 13MW3, 13MW4, 13MW5, 13MW6 and 13MW7. Sample 13MWDUP, a blind field duplicate for 13MW4, was also submitted for analysis. For this Appendix IX monitoring event, samples 13MW3, 13MW4, 13MW5, 13MW6 and 13MW7 were analyzed for 19 pesticides by SW-846 Method 8081A. Sample locations 13MW1 and 13MW2 are background wells and analysis was not required. The following information and attached table summarize the pesticide data review results.

CompuChem, a Division of Liberty Analytical, (CompuChem), of Cary, North Carolina, performed Method 8081A analysis. On behalf of RFAAP, CompuChem submitted results to Draper Aden Associates in a final certificate of analysis, which included sample analytical results as well as relevant documentation to validate and verify the results.

The evaluation of the laboratory's compliance with Method 8081A and validation of the results was based on a limited review of the following items: QC deliverables package, QC history documentation, case narrative, technical holding time and preservation requirements, extraction procedures, instrument calibrations, blank analysis, surrogate spike recoveries, retention time, matrix spike (MS/MSD) analyses, laboratory control samples (LCS), and internal standards requirements, where applicable. A review of transcriptions from instrument data to sample summary sheets was performed. Specific representative calculations were not performed, unless noted. The following information is intended to summarize data review results and any observed significant deviations from method and/or contractual requirements.

CompuChem received the samples on ice and in good condition, with custody seals intact. The chain of custody was appropriately signed and dated by field and laboratory personnel. Applicable holding time and preservation criteria were met.

The original certificate of analysis was received on May 28, 2009. The original certificate of analysis for Method 8081A was complete in its presentation and the data were of acceptable quality. The data set exhibited the laboratory's ability to achieve the reported QL for each target analyte, as outlined by the precision and accuracy data.

QC history documentation and QC check sample criteria were met. Calibration, DDT/Endrin breakdown, blank, surrogate, retention time, MS/MSD and LCS criteria were met, except where noted below. Sample results were reviewed for transcription errors from the

instrument data to the laboratory report and no errors were noted. No deviations from specific QA/QC criteria were identified.

For this Appendix IX monitoring event, results were reported to at or above the method detection limit. Sample results unaffected by the data validation process and not detected at or above the detection limit were validated and reported as "U." Results reported between the detection limit and quantitation limit were qualified as "J" to reflect the estimated concentration.

For this monitoring event, no target analytes were detected at or above the method detection limit or QL.

SW-846 METHOD 8151A HERBICIDE DATA REVIEW SUMMARY

Draper Aden Associates performed a comprehensive manual review of the analytical results for the April 13-14, 2009 semiannual groundwater monitoring event at the Open Burning Ground (HWMU 13) located at the Radford Facility Army Ammunition Plant (RFAAP), in Radford, Virginia. Draper Aden Associates collected groundwater samples from monitoring wells 13MW3, 13MW4, 13MW5, 13MW6 and 13MW7. Groundwater sample 13MWDUP was submitted to the laboratory as a blind sample duplicate for sample 13MW4. For this Appendix IX monitoring event, samples 13MW3, 13MW4, 13MW5, 13MW6 and 13MW7 were analyzed for four herbicides (2,4-D, silvex, 2,4,5-T and dinoseb) by USEPA SW-846 Method 8151A. Samples were also collected from background monitoring wells 13MW1 and 13MW2, however, herbicide analysis was not required for these sample locations. The following information and attached table summarize the data review results.

CompuChem, a Division of Liberty Analytical, (CompuChem) of Cary, North Carolina, performed the 8151A analysis. On behalf of RFAAP, CompuChem submitted results to Draper Aden Associates in a final certificate of analysis, which included sample analytical results as well as relevant documentation to validate and verify the results.

The evaluation of the laboratory's compliance with Method 8151A and validation of the results was based on a review of the following items: QC deliverables package, QC history documentation, case narrative, technical holding time and preservation requirements, extraction procedures, instrument calibrations, blank analysis, surrogate spike recoveries, retention time, matrix spike and spiked duplicate (MS/MSD) analyses, laboratory control samples (LCS), and internal standards requirements, where applicable. A review of transcriptions from instrument data to sample summary sheets was performed. Calculation checks for a minimum ten percent of the data set were performed. The following information is intended to summarize data review results and any observed significant deviations from method and/or contractual requirements.

CompuChem received the samples on ice and in good condition, with custody seals intact. Applicable holding time and preservation criteria were met. The chain of custody was appropriately signed and dated by field and laboratory personnel.

Method 8151A

The original certificate of analysis was received on May 28, 2009. The certificate of analysis for Method 8151A was complete in its presentation and the data were of acceptable quality. The method detection limit study and analyst initial demonstration of capability data were provided as a revision and submitted with the HWMU7 data package. The data set demonstrated the laboratory's ability to achieve the reported permit required quantitation limit (QL).

QC history documentation and QC check sample criteria were met. Initial calibration, calibration verification, blank, surrogate, MS/MSD (13MW5), retention time, and LCS criteria were met. Field duplicate/sample results exhibited acceptable precision, where applicable. Sample results were reviewed for transcription errors from the instrument data to the laboratory report and no errors were noted. No significant deviations from specific QA/QC criteria were identified during the review process.

No target analytes were detected at or above the detection limit or QL for this Appendix IX monitoring event. Sample results unaffected by the data validation process, and not detected at or above the detection limit and/or QL, were validated and reported as "U."

SW-846 METHOD 8330B DATA REVIEW SUMMARY

Draper Aden Associates performed a comprehensive manual review of the analytical results for the April 13-14, 2009 semiannual groundwater monitoring event at the Open Burning Ground (HWMU 13). Draper Aden Associates collected groundwater samples from monitoring wells 13MW1, 13MW2, 13MW3, 13MW4, 13MW5, 13MW6 and 13MW7. Groundwater sample 13MWDUP was submitted to the laboratory as a blind sample duplicate for 13MW4. Groundwater samples were analyzed for four (4) explosives analytes (1,3,5-trinitrobenzene, 1,3-dinitrobenzene, 2,6-dinitrotolune and 2,4-dinitrotolune) by SW-846 Method 8330B.

CompuChem, a division of Liberty Analytical Corporation (CompuChem), of Cary, North Carolina, performed the analysis. On behalf of RFAAP, CompuChem submitted results to Draper Aden Associates in a final certificate of analysis which included sample analytical results as well as relevant documentation to verify and validate the results. As per the laboratory's narrative, the data met the requirements outline in SW-846 8330B.

The evaluation of CompuChem's compliance with Method 8330B and validation of the results was based on a limited review of the following items: QC deliverables package, QC history documentation, case narrative, technical holding time and preservation requirements, extraction procedures, instrument calibrations, blank analysis, surrogate spike recoveries, retention time, matrix spike (MS/MSD) analyses, and laboratory control samples (LCS), where applicable. Review of transcriptions from instrument data to sample summary sheets was performed. Specific representative calculations were performed on ten percent of the certificate of analysis. The following information is intended to summarize data review results and any observed significant deviations from method and/or contractual requirements.

The laboratory received the samples on ice and in good condition with custody seals intact. The chain of custody was appropriately signed and dated by field and laboratory personnel. Technical holding time criteria were met. Sample extraction and analysis holding time criteria were met. Sample preservation criteria were met.

The original certificate of analysis was received on May 21, 2009 and was complete and presented data which were of acceptable quality. The data set exhibited the laboratory's ability to achieve the reported project quantitation limit (QL) as supported by the method detection limit (MDL) study, and QL standard. QC history documentation and QC check sample criteria were met. Initial calibration, calibration verification, blank, surrogate, retention time, MS/MSD and LCS criteria were met except where noted below. Sample results were reviewed for transcription errors from the instrument data to the laboratory report and no errors were noted. No deviations from specific QA/QC criteria were identified during the review process. No detections were reported in any sample at or above the detection limit or QL. Sample results were reported and evaluated to the detection limit for this Appendix IX monitoring event. Sample results unaffected by the data validation process were validated and reported as "U."

SW-846 METHOD 8332 DATA REVIEW SUMMARY

Draper Aden Associates performed a comprehensive manual review of the analytical results for the April 13-14, 2009 semiannual groundwater monitoring event at the Open Burning Ground (HWMU 13). Draper Aden Associates collected groundwater samples from monitoring wells 13MW1, 13MW2, 13MW3, 13MW4, 13MW5, 13MW6 and 13MW7. Groundwater sample 13MWDUP was submitted to the laboratory as a blind sample duplicate for 13MW4. Groundwater samples were analyzed for nitroglycerin by SW-846 Method 8332.

CompuChem, a Division of Liberty Analytical Corporation (CompuChem), of Cary, North Carolina, performed the analysis. On behalf of RFAAP, CompuChem submitted results to Draper Aden Associates in a final certificate of analysis which included sample analytical results as well as relevant documentation to verify and validate the results.

The evaluation of CompuChem's compliance with Method 8332 and validation of the results was based on a limited review of the following items: QC deliverables package, QC history documentation, case narrative, technical holding time and preservation requirements, extraction procedures, instrument calibrations, blank analysis, surrogate spike recoveries, retention time, matrix spike (MS/MSD) analyses, and laboratory control samples (LCS), where applicable. Review of transcriptions from instrument data to sample summary sheets was performed. Representative calculations of 10% of the data set were performed. The following information is intended to summarize data review results and any observed significant deviations from method and/or contractual requirements.

The laboratory received the samples on ice and in good condition with custody seals intact. The chain of custody was appropriately signed and dated by field and laboratory personnel. Technical holding time criteria were met. Sample extraction and analysis holding time criteria were met. Sample preservation criteria were met.

The original certificate of analysis was received on May 21, 2009. The original certificate of analysis for Method 8332 was complete and presented data which were of acceptable quality for nitroglycerin. The data set exhibited the laboratory's ability to achieve the reported project quantitation limit (QL) as supported by the method detection limit (MDL) study, and QL standard. QC history documentation and QC check sample criteria were met. Initial calibration, calibration verification, blank, surrogate, retention time, MS/MSD and LCS criteria were met except where noted below. Sample results were reviewed for transcription errors from the instrument data to the laboratory report and no errors were noted. Field duplicate/sample results exhibited acceptable precision, where applicable. No deviations from quality control criteria were identified during the review process. No detections were reported at or above the detection limit or QL. Sample results were reported and evaluated to the detection limit for this Appendix IX monitoring event. Sample results unaffected by the data validation process were validated and reported as "U."

USEPA METHOD 314.0 (PERCHLORATE) DATA VALIDATION

Draper Aden Associates performed a comprehensive manual review of the analytical results for the April 13-14, 2009 semiannual groundwater monitoring event at the Open Burning Ground (HWMU 13) located at the Radford Facility Army Ammunition Plant (RFAAP), in Radford, Virginia. Draper Aden Associates collected groundwater samples from monitoring wells 13MW1, 13MW2, 13MW3, 13MW4, 13MW5, 13MW6 and 13MW7. Groundwater sample 13MWDUP was submitted to the laboratory as a blind sample duplicate for sample 13MW4. For this Appendix IX monitoring event, the samples were analyzed for perchlorate by USEPA 314.0. The following information and attached table summarize the data review results.

CompuChem, a Division of Liberty Analytical, (CompuChem) of Cary, North Carolina, performed the analysis. On behalf of RFAAP, CompuChem submitted results to Draper Aden Associates in a final certificate of analysis, which included sample analytical results as well as relevant documentation to validate and verify the results.

The evaluation of CompuChem's compliance with the method and validation of results presented here are based upon a review of QA/QC information including chain-of-custody, case narrative, holding times, preservation procedures and calibration standards, matrix spike/matrix spike duplicate (MS/MSD), blank samples analyses (method, calibration and other blanks), and laboratory control sample (LCS) data. A review of transcriptions from instrument data to sample summary sheets was performed. Calculation verification checks were conducted on a minimum ten percent of the data set. A summary of data review results with any observed deviations is provided below.

CompuChem received the samples on ice and in good condition, with custody seals intact. The chain of custody was appropriately signed and dated by field and laboratory personnel. Applicable holding time and preservation criteria were met. CompuChem reported results in two separate certificates of analysis (0904103 and 0904098).

The original certificates of analysis were received on May 21, 2009 and May 28, 2009. The certificates of analysis was revised to include the method detection limit study and analyst initial demonstration of capability data. The revised certificate of analysis for Method 314.0 was complete in its presentation and the data were of acceptable quality. The data set demonstrated the laboratory's ability to achieve the required quantitation limit (QL).

QC history documentation and QC check sample criteria were met. Initial calibration, calibration verification, blank, MS/MSD (13MW5), and LCS criteria were met, except where noted below.

Perchlorate was detected in 13MW4 at 127 µg/l and in the blind field duplicate, 13MWDUP, at 124 µg/l. Field duplicate/sample results exhibited acceptable precision.

Perchlorate was also detected above the detection limit but less than the QL in sample 13MW6 (1.3 µg/l).

Sample results were reviewed for transcription errors from the instrument data to the laboratory report and no errors were noted. Deviations from specific QA/QC criteria that were identified during the review process are summarized below.

The laboratory did not analyze a conductance standard as required by the method. The laboratory stated that the analysis was established for perchlorate only and the conductance standard was not applicable. No additional data qualification was required.

Perchlorate was not detected at or above the detection limit or QL for this Appendix IX monitoring event in any samples other than 13MW4, 13MWDUP, and 13MW6. Sample results unaffected by the data validation process, and not detected at or above the detection limit and/or QL, were validated and reported as "U." No results were rejected based on the data validation criteria.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

N.D.	none detected	**BMQL**	Below Minimum Quantitation Level
TNTC	Too Numerous To Count	**MPN**	Most Probable Number
IU	International Units	**CP Units**	cobalt-chloroplatinate units
umhos/cm	micromhos/cm	**NTU**	nephelometric turbidity units
C	degrees Celsius	**F**	degrees Fahrenheit
Cal	(diet) calories	**lb.**	pound(s)
meq	milliequivalents	**kg**	kilogram(s)
g	gram(s)	**mg**	milligram(s)
ug	microgram(s)	**l**	liter(s)
ml	milliliter(s)	**ul**	microliter(s)
m3	cubic meter(s)	**fib >5 um/ml**	fibers greater than 5 microns in length per ml

< less than – The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.

> greater than

ppm parts per million – One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter of gas per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture.

U.S. EPA data qualifiers:

Organic Qualifiers

A	TIC is a possible aldol-condensation product
B	Analyte was also detected in the blank
C	Pesticide result confirmed by GC/MS
D	Compound quatitated on a diluted sample
E	Concentration exceeds the calibration range of the instrument
J	Estimated value
N	Presumptive evidence of a compound (TICs only)
P	Concentration difference between primary and confirmation columns >25%
U	Compound was not detected
X,Y,Z	Defined in case narrative

Inorganic Qualifiers

B	Value is <CRDL, but ≥IDL
E	Estimated due to interference
M	Duplicate injection precision not met
N	Spike amount not within control limits
S	Method of standard additions (MSA) used for calculation
U	Compound was not detected
W	Post digestion spike out of control limits
*****	Duplicate analysis not within control limits
+	Correlation coefficient for MSA <0.995

Analytical test results for methods listed on the laboratories' accreditation scope meet all requirements of NELAC unless otherwise noted under the individual analysis.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

The 6 aqueous samples were received intact, properly refrigerated between 0.1°C & 2.6°C, with proper documentation, in sealed shipping containers, on March 15th 2009. The samples were scheduled for the requested analysis of the Wet Chemistry fraction. The samples were analyzed, in accordance with current EPA methods, for the analytes requested as per the COC, with the exceptions and/or additions requested by the client.

SAMPLE IDs:
The cover page contained in this package lists the client ID's and the associated CompuChem numbers which are part of this SDG.

INSTRUMENTAL QUALITY CONTROL:
All calibration verification solutions (ICV & CCV), blanks (ICB, & CCB), associated with this data were confirmed to be within allowable limits.

SAMPLE PREPARATION QUALITY CONTROL:
The sample preparation procedure verifications (LCS/LCS Dup & PBW(Blank)) were found to be within acceptable ranges. The samples were prepared and analyzed within the contract specified holding times for IC 314.0 Perchlorate analysis. However, not all field samples were prepared and analyzed within the contract specified holding times for Sulfide 9034 analysis. **13MW5, 13MW3, 13MW4, 13MWDUP, and 13MW6 were missed by roughly 30 hours.**

000000
MATRIX RELATED QUALITY CONTROL:
13MW5 was used as the original to prepare the matrix spike and matrix spike duplicate.

I certify that this Sample Data Package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy Sample Data Package and in the electronic data deliverable has been authorized by the Laboratory Manager or the Manager's designee, as verified by the following signature.

2. SDG Narrative

The SDG Narrative contains laboratory information, the Case and SDG numbers, contract number, and detailed documentation of any QC, sample, shipment, and/or analytical problems encountered in processing the samples. This will include any technical and administrative problems encountered and the resolution or corrective actions taken. The SDG Narrative will also document the alternative means of determining the cooler temperature when a cooler's temperature indicator bottle is absent. The SDG Narrative also provides equations or curves and utilizes raw data from the SDG being reported to demonstrate how sample results are obtained from raw instrument output. The SDG Narrative also includes a discussion of any flexibility Statement of Work (SOW) modification, including attaching a copy of the USEPA approved modification form to the SDG Narrative. Finally, the SDG Narrative will identify and explain any differences between results being provided in the data package and those provided previously as Preliminary Results.

SDG NARRATIVE
SDG # 0906006

The indicated Sample Delivery Group (SDG) consisting of six (6) liquid samples was re-received into the laboratory information management system (LIMS) on June 1, 2009 intact and in good condition with Chain of Custody (COC) Records in order, unless otherwise noted in any attachments or Quality Assurance Notices. The temperature of the samples upon receipt was 0.1 to 2.6°C. Sample ID's reported in this data package are noted by the receiving department on the COC if they differ from those listed by the samplers on the COC.

The samples were prepared and analyzed in accordance with SW846-6020 methodology for the requested metals.

INSTRUMENTAL QUALITY CONTROL:

All calibration verification solutions (ICV & CCV), blanks (ICB & CCB), and interference check samples (ICSA & ICSAB) associated with this data were confirmed to be within allowable limits.

SAMPLE PREPARATION QUALITY CONTROL:

The sample preparation procedure verification (PBW & LCSWD) was found to be within acceptable ranges and the field samples were prepared and analyzed within the specified holding times.

MATRIX RELATED QUALITY CONTROL:

The sample matrix spikes, CCN = 0906006-01 ID 13MW5S and 13MW5SD were inside control limits for the requested analytes except tin.

Control limits for matrix spikes recoveries are set at 75% to 125% of the analyte quantity added unless original sample concentrations exceed the true values of these "spikes" by a factor of four or more. In this case, affected analytes are not flagged even if recoveries are outside percentage recovery control limits.

The sample matrix duplicate, CCN = 0906006-01 ID 13MW5D was inside control limits for the requested analytes.

CLP control limits for duplicate determinations are +/- 20% Relative Percent Difference (RPD) for concentrations greater than or equal to five times the CRDL in both the original and duplicate samples, and +/- the CRDL for concentrations less than five times the CRDL. The RPD is not calculated if both the original and duplicate values fall below the IDL.

A five-fold serial dilution of sample, CCN = 0906006-01 ID 13MW5L was performed in accordance with requirements for ICP/MS and mercury analysis.

The adjusted sample concentration was inside control limits for the requested analytes.

The laboratory manager or his designee, as verified by the following signature has authorized release of the data contained in this hard copy data package. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice.

DATA REPORTING QUALIFIERS FOR INORGANICS

On Form I, under the column labeled "C" for concentration qualifier and "Q" for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. Up to five qualifiers may be reported on Form I for each analyte.

The C (concentration) qualifiers used are:

U: This flag indicates the analyte was analyzed for but not detected. This reported value was obtained from a reading that was less than the Instrument Detection Limit (IDL). The IDL will be adjusted to reflect any dilution and, for soils, the percent moisture.

B: This flag indicates the analyte was analyzed for and the reported value was obtained from a reading that was less than the Contract Required Detection Limit (CRDL) but greater than or equal to the Method Detection Limit (MDL).

The Q qualifiers used are:

E: This flag indicates an estimated value. This flag is used:

1. When the serial dilution (a five fold dilution for CLP and a five fold dilution for SW-846 method 6010B) results are not within 10%. The analyte concentration must be sufficiently high (minimally a factor of 50X above the IDL in the original sample).

N: This flag indicates the sample spike recovery is outside of control limits:

*: This flag is used for duplicate analysis when the sample and the sample duplicate results are not within control limits.

The extensions: D, S, SD, L. A, added to the end of the client ID represent as follows:

D:	matrix duplicate
S:	matrix spike
SD:	matrix spike duplicate
L:	serial dilution
A:	post digestion spike

Method Codes:

P:	ICP PLASMA
CV:	MERCURY COLD VAPOR AA
CA:	MIDI-DISTILLATION SPECTROPHOTOMETRIC
MS:	MASS SPECTROMETRY
AS:	SEMI-AUTOMATED SPECTROPHOTOMETRIC

4. Digestion and Distillation Logs

The following logs shall be submitted, as appropriate, for each preparation procedure: digestion logs for ICP-AES, ICP-MS, mercury preparations, and cyanide. The logs shall include: (1) date; (2) sample weights and volumes, with initial sample weight/volume and final volume clearly indicated; (3) sufficient information to unequivocally identify which QC samples (i.e., LCS, PB) correspond to each batch digested; (4) comments describing any significant sample changes or reactions which occur during preparation shall be entered in the log and noted in the SDG Narrative; (5) indication of pH less than 2 or greater than 12, as applicable; (6) identification of the sample preparer(s) [signature (s)].

2. SDG Narrative

The SDG Narrative contains laboratory information, the Case and SDG numbers, contract number, and detailed documentation of any QC, sample, shipment, and/or analytical problems encountered in processing the samples. This will include any technical and administrative problems encountered and the resolution or corrective actions taken. The SDG Narrative will also document the alternative means of determining the cooler temperature when a cooler's temperature indicator bottle is absent. The SDG Narrative also provides equations or curves and utilizes raw data from the SDG being reported to demonstrate how sample results are obtained from raw instrument output. The SDG Narrative also includes a discussion of any flexibility Statement of Work (SOW) modification, including attaching a copy of the USEPA approved modification form to the SDG Narrative. Finally, the SDG Narrative will identify and explain any differences between results being provided in the data package and those provided previously as Preliminary Results.

SDG NARRATIVE
SDG # 0904098

The indicated Sample Delivery Group (SDG) consisting of six (6) liquid samples was received into the laboratory information management system (LIMS) on April 15, 2009 intact and in good condition with Chain of Custody (COC) Records in order, unless otherwise noted in any attachments or Quality Assurance Notices. The temperature of the samples upon receipt was 0.1 to 2.6°C. Sample ID's reported in this data package are noted by the receiving department on the COC if they differ from those listed by the samplers on the COC.

The samples were prepared and analyzed in accordance with SW846-6020 methodology for the requested metals, mercury, and cyanide.

INSTRUMENTAL QUALITY CONTROL:

All calibration verification solutions (ICV & CCV), blanks (ICB & CCB), and interference check samples (ICSA & ICSAB) associated with this data were confirmed to be within allowable limits.

SAMPLE PREPARATION QUALITY CONTROL:

The sample preparation procedure verification (PBW, LCSW, & LCSWD) was found to be within acceptable ranges and the field samples were prepared and analyzed within the specified holding times. All of the samples were reported at a dilution. The internal standards failed in the initial analysis.

MATRIX RELATED QUALITY CONTROL:

The sample matrix spikes, CCN = 09040988-01 ID 13MW5S and 13MW5SD were inside control limits for the requested analytes except antimony, arsenic, selenium, and tin.

Control limits for matrix spikes recoveries are set at 75% to 125% of the analyte quantity added unless original sample concentrations exceed the true values of these "spikes" by a factor of four or more. In this case, affected analytes are not flagged even if recoveries are outside percentage recovery control limits.

The sample matrix duplicate, CCN = 0904098-01 ID 13MW5D was inside control limits for the requested analytes.

CLP control limits for duplicate determinations are +/- 20% Relative Percent Difference (RPD) for concentrations greater than or equal to five times the CRDL in both the original and duplicate samples, and +/- the CRDL for concentrations less than five times the CRDL. The RPD is not calculated if both the original and duplicate values fall below the IDL.

A five-fold serial dilution of sample, CCN = 0904098-01 ID 13MW5L was performed in accordance with requirements for ICP/MS and mercury analysis.

The adjusted sample concentration was inside control limits for the requested analytes.

The laboratory manager or his designee, as verified by the following signature has authorized release of the data contained in this hard copy data package. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice.

DATA REPORTING QUALIFIERS FOR INORGANICS

On Form I, under the column labeled "C" for concentration qualifier and "Q" for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. Up to five qualifiers may be reported on Form I for each analyte.

The C (concentration) qualifiers used are:

U: This flag indicates the analyte was analyzed for but not detected. This reported value was obtained from a reading that was less than the Instrument Detection Limit (IDL). The IDL will be adjusted to reflect any dilution and, for soils, the percent moisture.

B: This flag indicates the analyte was analyzed for and the reported value was obtained from a reading that was less than the Contract Required Detection Limit (CRDL) but greater than or equal to the Method Detection Limit (MDL).

The Q qualifiers used are:

E: This flag indicates an estimated value. This flag is used:

1. When the serial dilution (a five fold dilution for CLP and a five fold dilution for SW-846 method 6010B) results are not within 10%. The analyte concentration must be sufficiently high (minimally a factor of 50X above the IDL in the original sample).

N: This flag indicates the sample spike recovery is outside of control limits:

*: This flag is used for duplicate analysis when the sample and the sample duplicate results are not within control limits.

The extensions: D, S, SD, L. A, added to the end of the client ID represent as follows:

D: matrix duplicate
S: matrix spike
SD: matrix spike duplicate
L: serial dilution
A: post digestion spike

Method Codes:

P: ICP PLASMA
CV: MERCURY COLD VAPOR AA
CA: MIDI-DISTILLATION SPECTROPHOTOMETRIC
MS: MASS SPECTROMETRY
AS: SEMI-AUTOMATED SPECTROPHOTOMETRIC

Carrier, 0.25M NaOH- 04 27 09 jm	In a 1 L volumetric flask, dissolve 10.0 g of NaOH in 800 mL of reagent water. Dilute to the mark and invert t mix. To prevent bubble formation, degas using a vacuum pump.
Phosphate Buffer- 04 10 09 JM	In a 1 L volumetric flask, dissolve 97 g of potassium phosphate monobasic anhydrous in 800 mL of reagent water. Dilute to the mark and invert to mix. To prevent bubble formation, degas using a vacuum pump.
Chloramine-T- 04 27 09 jm	To a 500 mL volumetric flask, add 250 mL of reagent water followed by 2 g of Chloramines-T. Dilute to the mark and invert to mix. To prevent bubble formation, degas using a vacuum pump. Prepare fresh daily.
Pyridine-Barbituric Acid- 04 08 09 JM	CAUTION – Always use a fume hood when preparing this reagent. Always wear a face shield when dispensing concentrated acids. This reagent has a six-month shelf – life if stored at 4 °C. In the fume hood, place 15.0 g of barbituric acid in a 1 L beaker and add 100 mL of reagent water, rinsing down the sides of the beaker to wet the barbituric acid. Stir in 75 mL of pyridine (C_5H_5N) and mix until the barbituric acid dissolves. Add 15 mL of concentrated hydrochloric acid (12M HC1) and mix. Transfer to a 1 L volumetric flask, dilute to volume with reagent, and invert to mix. To prevent bubble formation, degas using a vacuum pump.

4. Digestion and Distillation Logs

The following logs shall be submitted, as appropriate, for each preparation procedure: digestion logs for ICP-AES, ICP-MS, mercury preparations, and cyanide. The logs shall include: (1) date; (2) sample weights and volumes, with initial sample weight/volume and final volume clearly indicated; (3) sufficient information to unequivocally identify which QC samples (i.e., LCS, PB) correspond to each batch digested; (4) comments describing any significant sample changes or reactions which occur during preparation shall be entered in the log and noted in the SDG Narrative; (5) indication of pH less than 2 or greater than 12, as applicable; (6) identification of the sample preparer(s) [signature (s)].

2. SDG Narrative

The SDG Narrative contains laboratory information, the Case and SDG numbers, contract number, and detailed documentation of any QC, sample, shipment, and/or analytical problems encountered in processing the samples. This will include any technical and administrative problems encountered and the resolution or corrective actions taken. The SDG Narrative will also document the alternative means of determining the cooler temperature when a cooler's temperature indicator bottle is absent. The SDG Narrative also provides equations or curves and utilizes raw data from the SDG being reported to demonstrate how sample results are obtained from raw instrument output. The SDG Narrative also includes a discussion of any flexibility Statement of Work (SOW) modification, including attaching a copy of the USEPA approved modification form to the SDG Narrative. Finally, the SDG Narrative will identify and explain any differences between results being provided in the data package and those provided previously as Preliminary Results.

SDG NARRATIVE
SDG # 0904103

The indicated Sample Delivery Group (SDG) consisting of two (2) liquid samples was received into the laboratory information management system (LIMS) on April 15, 2009 intact and in good condition with Chain of Custody (COC) Records in order, unless otherwise noted in any attachments or Quality Assurance Notices. The temperature of the samples upon receipt was 0.1 to 2.6°C. Sample ID's reported in this data package are noted by the receiving department on the COC if they differ from those listed by the samplers on the COC.

The samples were prepared and analyzed in accordance with SW846-6020 methodology for the requested metals and mercury.

INSTRUMENTAL QUALITY CONTROL:

All calibration verification solutions (ICV & CCV), blanks (ICB & CCB), and interference check samples (ICSA & ICSAB) associated with this data were confirmed to be within allowable limits.

SAMPLE PREPARATION QUALITY CONTROL:

The sample preparation procedure verification (PBW, LCSW, & LCSWD) was found to be within acceptable ranges and the field samples were prepared and analyzed within the specified holding times.

MATRIX RELATED QUALITY CONTROL:

No matrix spikes were requested for this SDG.

A five-fold serial dilution of sample, CCN = 0904103-01 ID 13MW1L was performed in accordance with requirements for ICP/MS analysis and CCN = 0904103-02 ID 13MW2L was performed for mercury.

The adjusted sample concentration was inside control limits for the requested analytes.

The laboratory manager or his designee, as verified by the following signature has authorized release of the data contained in this hard copy data package. Furthermore, I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice.

DATA REPORTING QUALIFIERS FOR INORGANICS

On Form I, under the column labeled "C" for concentration qualifier and "Q" for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. Up to five qualifiers may be reported on Form I for each analyte.

The C (concentration) qualifiers used are:

U: This flag indicates the analyte was analyzed for but not detected. This reported value was obtained from a reading that was less than the Instrument Detection Limit (IDL). The IDL will be adjusted to reflect any dilution and, for soils, the percent moisture.

B: This flag indicates the analyte was analyzed for and the reported value was obtained from a reading that was less than the Contract Required Detection Limit (CRDL) but greater than or equal to the Method Detection Limit (MDL).

The Q qualifiers used are:

E: This flag indicates an estimated value. This flag is used:

1. When the serial dilution (a five fold dilution for CLP and a five fold dilution for SW-846 method 6010B) results are not within 10%. The analyte concentration must be sufficiently high (minimally a factor of 50X above the IDL in the original sample).

N: This flag indicates the sample spike recovery is outside of control limits:

*: This flag is used for duplicate analysis when the sample and the sample duplicate results are not within control limits.

The extensions: D, S, SD, L. A, added to the end of the client ID represent as follows:

D: matrix duplicate
S: matrix spike
SD: matrix spike duplicate
L: serial dilution
A: post digestion spike

Method Codes:

P: ICP PLASMA
CV: MERCURY COLD VAPOR AA
CA: MIDI-DISTILLATION SPECTROPHOTOMETRIC
MS: MASS SPECTROMETRY
AS: SEMI-AUTOMATED SPECTROPHOTOMETRIC

4. Digestion and Distillation Logs

The following logs shall be submitted, as appropriate, for each preparation procedure: digestion logs for ICP-AES, ICP-MS, mercury preparations, and cyanide. The logs shall include: (1) date; (2) sample weights and volumes, with initial sample weight/volume and final volume clearly indicated; (3) sufficient information to unequivocally identify which QC samples (i.e., LCS, PB) correspond to each batch digested; (4) comments describing any significant sample changes or reactions which occur during preparation shall be entered in the log and noted in the SDG Narrative; (5) indication of pH less than 2 or greater than 12, as applicable; (6) identification of the sample preparer(s) [signature (s)].

SDG # 0904098
PROTOCOL: SW-846

SAMPLE IDENTIFICATIONS: 13MW3, 13MW4, 13MW5, 13MW6, 13MW7, 13MWDUP

The six water samples listed above were received intact, refrigerated between 0.1 and 2.6°C, with proper documentation, in sealed shipping containers, on April 15, 2009. The samples were scheduled for the requested analysis of the Pesticide fraction only. SW-846, 3rd Edition, Update 3, Method 8081A was used to prepare and analyze the samples, with the exceptions and/or additions requested by the client. All pertinent Quality Assurance notices are included in the narrative section and all pertinent Laboratory notices for SDG # 0904098 are included in the sample data sections.

Pesticide

Extraction and analysis holding time requirements were met for the samples. This SDG was further cleaned with the Florisil cleanup process.

No target analytes confirmed above the reporting limits in samples.

All QC criteria were met for all initial and continuing calibration standards associated to this SDG.

All surrogate recoveries were with the method specified limits.

The method blank associated with the samples met all quality control criteria.

Matrix spike/matrix spike duplicate samples were performed with sample 13MW5, and met recovery and precision criteria, with the exception of the recovery of Aldrin in the MSD. The Laboratory Control Sample (LCS) prepared and analyzed with the samples met recovery criteria.

An uncertainty of these test results may be estimated from the recovery of the surrogates added to the sample prior to sample preparation or from the recovery of spiked compound(s) in the associated laboratory control sample. Further information is available upon request.

I certify that the tests used in this report meet all requirements of the NELAC standards unless otherwise stated in the SDG narrative or QA notice.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hardcopy data package and in the computer-readable data submitted on CD has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

CompuChem's Pagination Convention

As required by the EPA CLP Statement of Work (SOW) documents, data to be delivered must be paginated (by machine or hand). In the event that the initial numbering is incorrect (a page numbered twice or a page skipped, for example), it is CompuChem's policy to add an alphabetic suffix to a page number when necessary (e.g., 100A, 100B, etc.).

Notification Regarding Manual Editing/Integration Flags

In some instances, manual adjustments to the software output are necessary to provide accurate data. These manual integrations are performed by the data reviewers, GC/MS operators, or GC chemists. An Extracted Ion Current Profile (EICP) or a GC chromatographic peak has been provided for the manual integration performed on each compound to demonstrate the accuracy of that process. The manual integrations are flagged on the quantitation report in the far right column beyond the FINAL concentration for GC/MS analysis, and in the "Flags" column for GC analysis. The manual editing/integration flags are:

M - Denotes that a manual integration has been performed for this compound. The manual integration was performed in order to provide the most accurate area count possible for the peak.

H - Denotes that the data reviewer, GC/MS operator, or GC Chemist has chosen an alternate peak within the retention time window from that chosen by the software for that compound. No manual integration is performed in choosing an alternate peak. The software still performs the integration.

MH - Denotes that an alternate peak has been chosen within the retention time window from that chosen by the software for that compound and also a manual integration of the chosen peak has been performed. The manual integration was performed in order to provide the most accurate area count possible for the peak.

L - Denotes that a data reviewer or GC/MS operator has selected an alternate library search. This is typically done when an additional tentatively identified compound (TIC) has been added to the number of peaks searched. No manual integration is performed in choosing an alternate peak. The software still performs the integration.

ML - Denotes that an alternate library search has been selected and a manual integration has also been performed. This is typically done when an additional TIC has been added and the TIC peak also required a manual integration.

The EPA CLP SOW documents require additional explanations for manual editing/integration. In the accompanying raw data packages, additional codes have been applied to the "M" flag and carry the following meanings;

M1 - The compound was not found by the automatic integration routine.

M2 - The compound was incorrectly integrated by the automatic integration routine.

M3 - The co-eluting compounds were incorrectly integrated by the automatic integration routine.

These codes will appear in the GC/MS and GC raw data.

DATA REPORTING QUALIFIERS

On the Form I, under the column labeled "Q" for qualifier, each result is flagged with the specific data reporting qualifiers listed below, as appropriate. Up to five qualifiers may be reported on Form I for each compound. The qualifiers used are:

U : This flag indicates the compound was analyzed for but not detected. The Contract Required Quantitation Limit (CRQL), or reporting limit, will be adjusted to reflect any dilution and, for soils, the percent moisture.

J : This flag indicates an estimated value. The flag is used as detailed below:

1. When estimating a concentration for tentatively identified compounds (TICs) where a response factor of 1:1 is assumed for the TIC analyte,

2. When the mass spectral and retention time data indicate the presence of a compound that meets the volatile and semivolatile GC/MS identification criteria, and the result is less than the adjusted CRQL (or Reporting Limit) but greater than zero, and

3. When the retention time data indicate the presence of a compound that meets the pesticide and/or Aroclor or other GC or HPLC identification criteria, and the result is less than the adjusted CRQL (or Reporting Limit) but greater than zero. For example, if the CRQL (or Reporting Limit) is 10 µg/L, but a concentration of 3 µg/L is calculated, it is reported as 3J.

N : This flag indicates presumptive evidence of a compound. This flag is only used for TICs, where the identification is based on a mass spectral library search and must be used with the J flag. For generic characterization of a TIC such as "chlorinated hydrocarbon" (or for an "unknown," with no matches ≥ 85% in the SOM01.2 SOW document), the N flag is not used.

P : In the EPA's Contract Laboratory Program (CLP), this flag is used for a pesticide/Aroclor target analyte, when there is greater than 25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on the Form I and flagged with a P.
For SW-846 GC and HPLC analyses, when the Relative Percent Difference (RPD) is greater than 40% and there is no evidence of chromatographic anomalies or interferences, then the higher of the two values is reported and flagged with a P. When the RPD is equal to or less than 40%, our policy is to also report the higher of the two values, although the choice could be a project specific issue. For certain HPLC analyses, if one of the HPLC columns displays co-elution of target analytes, all results are reported from a primary column displaying no co-elution. Results are still flagged with a P if the RPD between columns is greater than 40%.

C : This flag applies to GC or HPLC results where the identification has been confirmed by GC/MS. If GC/MS confirmation was attempted but was unsuccessful, this flag is not applied; a laboratory-defined flag is used instead (see the X/Y/Z qualifier.)

DATA REPORTING QUALIFIERS (continued)

B : This flag is used when the analyte is found in the associated blank as well as in the sample. It indicates probable blank contamination and warns the data user to take appropriate action. This flag is used for a TIC as well as for a positively identified target compound. The combination of flags BU or UB is not an allowable policy. Blank contaminants are flagged B only when they are detected in the sample.

E : This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis. If one or more compounds have a concentration greater than the upper level of the calibration range, the sample or extract will be diluted and reanalyzed. All such compounds with a concentration greater than the upper level of the calibration range will have the result flagged with an E on Form I for the original analysis.

D : If a sample or extract is reanalyzed at a higher dilution factor, for example when the concentration of an analyte exceeds the upper calibration range, the DL suffix is appended to the sample number on the Form I for the more diluted sample, and **all** reported concentrations on that Form I are flagged with the D flag. This flag alerts data users that any discrepancies between the reported concentrations may be due to dilution of the sample or extract.

NOTE 1: The D flag is not applied to compounds which are not detected in the sample analysis i.e. compounds reported with the CRQL (or Reporting Limit) and the U flag.

NOTE 2: Separate Forms I are used for reporting the original analysis (Client Sample No. XXXXX) and the more diluted sample analysis (Client Sample No. XXXXXDL) i.e. the results from both analyses are not combined on a single Form I.

A: This flag indicates that a TIC is a suspected aldol-condensation product.

S: In the SOM01.2 SOW document, this flag is used to indicate an estimated value for Aroclor target compounds where a valid 5-point initial calibration was not performed prior to the analytes detection in a sample. If an "S" flag is used for a specific Aroclor, then a reanalysis of the sample is required after a valid 5-point calibration is performed for the detected Aroclor.

X/Y/Z : Other specific flags may be required to properly define the results. If used, the flags will be fully described in the SDG Narrative. The laboratory-defined flags are limited to X, Y, and Z.
