Re: Radford Army Ammunition Plant, Va.
Review of Army's Final RCRA Facility Investigation Report for
Solid Waste Management Unit (SWMU) 13

Dear Mr. McKenna and Ms. Holt:

The U.S. Environmental Protection Agency (EPA) and Virginia Department of Environmental Quality (VDEQ) have reviewed the U.S. Army's (Army's) July 2010 Final RCRA Facility Investigation (RFI) Report for SWMU 13, located at the Radford Army Ammunition Plant (RFAAP) in Radford, Virginia. Based upon our review, the report is approved, and in accordance with Part II. (E) (5) of RFAAP's Corrective Action Permit, it can now be considered final.

If you have any questions, please call me at 215-814-3413. Thanks.

Sincerely,

William Geiger
RCRA Project Manager
Office of Remediation (3LC20)

Response to EPA/DEQ RTCs (Received via e-mail March 29, 2010) to Responses to Comments (Original Responses dated Feb 10, 2010) for Study Area at SWMU 13 RFI Report (July 2009)

1. EPA and VADEQ disagree that no hot spots for lead are present at SWMU 13. Two sample locations show lead concentrations that are substantially higher than lead levels reported in the remaining SWMU 13 samples. Acute risks associated with hot spot exposure should be evaluated, and to this end, EPA performed a risk analysis of these two areas. The Agency concludes that contact with conservatively drawn exposure areas of SWMU 13 is not expected to pose short term risks. However, in consideration of the substantially elevated lead result of 26,500 mg/kg for sample 13SB11B, institutional controls will be required to prevent future digging at this SWMU.

Response: The last sentences of the Executive Summary and Section 8.0 will be revised as follows: "Based on the results of the RFI, HHRA, and SLERA, no further action beyond the implementation of institutional controls to prevent future digging at the RFI study area is recommended.

The following text will also be added to the Executive Summary and Section 8: "Institutional controls are being implemented at the RFI study area at SWMU 13 within the boundaries depicted on Figure 1-2. The objective of the ICs is to prevent future digging at the site. Specifically this site has been incorporated into plant management manual to ensure long-term protection of human health and the environment. The management manual provides for advance notice, assessment and approval of intrusive work that may occur within the plant with a general digging prohibition at sites such as this. In the event the property is transferred or leased, equivalent ICs will be put into terms and conditions of the deed or lease, which are no less restrictive than the IC objectives described above. Furthermore, the transferee or lessee will be responsible for ensuring IC compliance by any future users. However, the Army acknowledges the responsibility for all original liability under CERCLA and its right and responsibility to enforce ICs."

2. The data identified in this comment (1997 study) should be incorporated in the conceptual/mass balance model discussion of soil concentrations left in place and ramifications to river sediment concentrations, etc. How does this lead concentration compare to analyses from other nearby locations?

Response: Prior to the SSP/RFI, historical soil analytical data (1997 study) were considered screening level data and excluded from the risk assessment given the age of the data, the lack of available data validation reports/information, the lack of coordinates to accurately locate the samples, and the availability of sufficient newer validated sediment data to more appropriately characterize conditions. In addition due to the transient nature of the river, the most recent sediment concentrations (SWMU 54 RFI/CMS Report 2008) would be more appropriate to characterize sediment conditions within the river. Per the EPA partnering meeting (February 2010), a mass balance analysis was conducted for the site utilizing annual runoff estimates and estimates of runoff for a 10-year storm event. See calculations in Attachment 1 (Calculations will be provided in an Appendix within the RFI report). The following summary of the results will be added to Section 4.

"Although previous sediment sampling results (Section 2.2.5) did not indicate the site had historically significantly affected the New River based on the detected lead concentrations at the study area, an assessment of the study area as a potential future source of lead loading in the New River was conducted. The site area assessed is limited to the 1.6 acre study area. The presence of

Soil Loss Calculations

Calculation #2 - Single Event Soil Loss

Modified Universal Soil Loss Equation (MUSLE)

$Y = 95(Q \cdot q)^{0.56}\ K \cdot LS \cdot C \cdot P$
$= 95(0.147 \cdot 4.35)^{0.56}\ 0.24 \cdot 4.4 \cdot 0.004 \cdot 1 = 0.3$ tons of soil

Y = single storm sediment yield in tons

Q = storm runoff volume = $[(P-0.2S)^2/(P+0.8S)]$ (inches)
= 1.1 inches = 0.092 ft = 0.092 ft · 1.6 acres = 0.147 acre-ft
P = Rainfall Depth = 3.63 inches (Virginia Department on Conservation and Recreation - 10 Year Storm 24 Hour for Pulaski County)
S = 1000/CN-10 = 1000/70-10 = 4.3
CN = SCS Curve Number = 70 (Soil Group C – Forest Good Condition)

q = peak flow = C·I·A
= 0.4·6.8·1.6 = 4.35 ft^3/sec
C = Manning's Runoff Coefficient for Sheet Flow = 0.4 (for woods – light underbrush)
I = Rainfall Intensity = 6.8 in/hour (Roanoke County IDF Curve – Duration 5 min due length of overland flow and slope)
A = Drainage Area = 1.6 acres

K = Soil Erodibility Factor = 0.24 (Wheeling Sandy Loam)

LS = factor for horizontal length of slope and slope gradient = 0.77·5.7 = 4.4
L = $(\lambda/72.6)^m$ = 0.77
λ = slope length= 43 feet
m= slope length factor = 0.5 (slope > 5%)
S = $(16.8 \sin(\Theta))-0.5$ = 5.7
Θ= slope angle = 21.8 degrees

C = factor for planned cover = 0.004 (from Table 11 - USDA 1978 – 70-45% cover trees and undergrowth, 85-75% duff coverage)

P = factor for management options = 1 (default)

Lead In Soil = 0.3 tons · 314 mg/kg average lead in surface soil · 2000 lbs/ton · 1kg/2.2 lbs · 1E-06 kg/mg
= 0.09 kg of lead

Attachment 2

Revised Section 5

the less volatile the chemical. Values of Henry's constant for soil COPCs are summarized in Table 5-2.

One VOC (TCE) and one SVOC (naphthalene) with Henry's constants less than 0.1 were identified as COPCs for the soil-to-groundwater migration pathway based on detections in one or more samples above calculated site-specific SLs (Section 5.1.4). Low concentrations of these COPCs have been detected in soil and therefore, volatilization is not expected to be a significant influence on the fate of this compound in soil. Other COPCs at the site are characterized by low Henry's constants (i.e., < 0.01) and are not considered highly volatile, and therefore, volatilization is not expected to be a significant influence on the fate of these compounds at the site.

5.1.2 Erosion Processes in Soil

Erosion processes can substantially affect the distribution of soil-bound particulates in the environment and thus influence the distribution of constituents in soil. High winds can scour fine particles from the soil surface and redistribute these particles downwind. Mass transport from surface water runoff during heavy precipitation events can also scour fine soil particles from surface soil, eventually depositing the particles during sedimentation downstream. As presented in Section 4.4, this potential migration pathway is impeded by the presence of significant vegetation in the RFI study area. Section 4.4 presents a quantitative evaluation of soil erosion in the RFI study area with respect to potential lead transport to the adjacent New River by erosion processes. The results of this evaluation indicated that minimal mass of lead would be potentially transported to the river by erosion processes and the potential soil loss is not considered a significant future risk to the New River.

5.1.3 Degradation of Chemicals in Soil

Many organic chemicals that are found in the environment are subject to naturally occurring biotic (biologically based) and abiotic (non-biologically based) transformation reactions. These reactions result in degradation of the chemical. Biodegradation reactions can occur under aerobic (in the presence of oxygen) and anaerobic (in the absence of oxygen) conditions. During biodegradation, naturally occurring microorganisms in the subsurface transform a chemical to another state as a direct or indirect consequence of their metabolic processes. In many cases, biodegradation reactions break down organic chemicals to less toxic forms.

Several naturally occurring abiotic reactions can significantly affect the fate of chemicals in the environment. Common abiotic reactions include photodegradation and hydrolysis. Photodegradation is the process of decomposition of a chemical upon exposure to radiant energy such as the action of light, and is most significant to chemicals in surface soil that are in direct contact with sunlight. Hydrolysis is the degradation reaction of the chemical with components of water (e.g., hydroxyl and hydronium ions) and is therefore most important in saturated environments.

5.1.3.1 Metals

Metal COPCs, such as antimony, iron, lead, and thallium will not be significantly influenced by degradation processes in soil.

5.1.3.2 VOCs

VOCs were detected low concentrations in soil at the site. The VOC COPC identified for the soil-to-groundwater migration pathway was TCE.

TCE: TCE was detected in 3 of 14 samples at low level concentrations. TCE is resistant to aerobic degradation in soil although biodegradation may proceed co-metabolically. Under anaerobic conditions, TCE is slowly biodegraded through reductive dechlorination, with the

rapid rate of photolysis observed in water. DNT is not expected to undergo hydrolysis in soil due to a lack of functional hydrolyzable functional groups (HSDB 2009).

Nitroglycerin undergoes rapid biodegradation using batch reactors and digestors but its rate of biodegradation in soil is unknown. Hydrolysis of nitroglycerin in soil may be important under alkaline conditions but is not expected to be an operable degradation process at the site due to the neutral pH of the soil (HSDB 2009).

5.1.4 Leaching of Chemicals from Soil to Groundwater

Chemicals in soil have the potential to migrate to greater depths with infiltrating water. As precipitation infiltrates, chemicals may be leached from the soil and carried to greater depths and potentially to groundwater. Table 5-3 summarizes the screening results for soil data including: constituents detected, minimum and maximum concentrations detected, number of detections, number of samples, and number of samples above risk-based soil to groundwater screening levels (SLs) and background (inorganics only) to evaluate the potential migration of chemicals in soil to groundwater. Risk-based SLs were obtained from the April 2009 Regional Screening table (USEPA 2009) and utilize a dilution attenuation factor (DAF) 10. A DAF 10 was used for the site due to the lack of an infinite source, the depth to groundwater, and the attenuation of chemicals due to soil types. The screening identified the following chemicals with detected concentrations above their generic DAF 10 SLs and background point estimates (inorganics only):

Chemical	# Detects/ # Samples	# Detects Above SL
Iron	32/32	2
Thallium	32/32	1
Trichloroethene	3/14	3
Benzo(a)anthracene	25/32	2
Benzo(a)pyrene	29/32	12
Benzo(b)fluoranthene	29/32	1
Naphthalene	10/32	4
2,4,6-Trinitrotoluene	5/32	5
2.6-Dinitrotoluene	1/32	1
Nitroglycerin	6/32	6

Factors affecting leaching are discussed below followed by assessments for soil to groundwater COPCs identified summarized above with concentrations above SLs. The degree to which a chemical is leached is strongly influenced by the chemical's tendency to partition to the solid or aqueous phases, which is largely a function of the chemical's solubility and particle affinity.

Water Solubility

Water solubility of a chemical is the mass of chemical that will dissolve in a unit volume of water at a specific temperature. Chemicals with a high solubility can often be readily dissolved in water and therefore are susceptible to being mobilized from the soil matrix with infiltrating water and migrating downward to groundwater. Chemicals with a low solubility tend to partition to soil.

The solubility of organic chemicals is typically a function of the hydrophobic nature of the chemical. Many organic chemicals are non-polar and therefore do not dissolve readily into water, which is a polar solution. The organic COPCs identified in soil at the site (PAHs and nitroglycerin) have low to moderate water solubility. Water solubility data for COPCs are summarized in Table 5-2.

Parameter	Definition (Units)	Value	Source
θ_w	Water-filled soil porosity, (L_{water}/L_{soil})	0.3	Default (USEPA 2002)
θ_a	Air-filled soil porosity, (L_{air}/L_{soil}), ($\eta - \theta_w$)	0.09	Calculated based on Average of RFI Physical Soil Results
ρ_b	Dry soil bulk density	1.61 kg/L	Average of RFI Physical Soil Test Results (Table 2-1)
H'	Henry's law constant	Chemical-specific	RAIS (2007)

Notes: RAIS = Risk Assessment Information System – Chemical Specific Factors at http://rais.ornl.gov/

Detailed SL calculations are presented in Appendix C.7. The leaching potential of COPCs is evaluated in the following based on the chemical properties of the COPCs, comparisons of the site data to SLs, and an evaluation of groundwater data from the OBG (source of chemicals in the RFI Study Area).

5.1.4.2 Iron

Iron naturally occurs at appreciable levels in soil at RFAAP with a background point estimate of 50,962 mg/kg. Adsorption of iron to soil is dependent on pH and organic matter, with an increase in either of these parameters resulting in increased adsorption. Mobility is also influenced by oxidation reduction potential, with iron becoming more mobile under reducing conditions than oxidizing conditions (HSDB 2009). Soil pH values are in the range of 5 to 7 and will likely reduce the mobility of iron along with the presence of appreciable organic matter in surface and near surface soil (3.5%). Site data indicate that iron concentrations detected above the SL and background point estimate are limited to surface or near surface intervals in 2 of 32 samples collected from the RFI study area. In addition as presented in Section 6.4.2, background statistical evaluations identified iron as consistently below background. Based on the background evaluation, near neutral pH of site soil, and appreciable organic matter in surface and near surface soil, iron is not considered a potential concern for the soil-to-groundwater pathway in the RFI study area.

5.1.4.3 Lead

Although lead does not have a risk-based soil to groundwater SL (USEPA 2009), due to the nature of the RFI study area the migration of lead from soil to groundwater was assessed utilizing the SESOIL model. The SESOIL unsaturated zone fate-and-transport model was used to evaluate the mobility of lead in soil within the RFI study area (Environmental Software Consultants, Inc., 2008). SESOIL is a one-dimensional vertical fate-and-transport screening level model for the unsaturated zone. It simulates chemical fate-and-transport based on diffusion, adsorption, volatilization, biodegradation, and hydrolysis. The model is designed to simultaneously model both chemical and soil water transport in the soil column under natural seasonal climatic variations.

Lead mass loading parameters for this assessment assumed a lead concentration equal to the mean concentration detected in site soil (414 milligram per kilogram) across the entire 1.6 study area for a depth interval of 0 to 5.5 ft. Local climate data for Radford, Virginia and site-specific physical soil data were also incorporated into the assessment.

The results of the SESOIL assessment indicated that over the 30-year period modeled, lead is immobile in site soil, with 99.87 percent of the lead mass remaining adsorbed to soil, with the remaining mass present in the soil air phase. Over the 30-year modeled period, the net change in

COPC	Detected Concentrations (mg/kg)			MDC Above SL	Mean Above SL
	MDC	Mean	Site-Specific SL		
Benzo(a)anthracene	0.480	0.056	0.67	No	No
Benzo(a)pyrene	0.290	0.047	0.23	Yes (1)	No
Benzo(b)fluoranthene	0.630	0.086	2.3	No	No
Naphthalene	0.022	0.0032	0.026	No	No

High molecular weight PAHs identified as COPCs tend to be immobile in soil due to negligible solubility and high K_{oc} values. High molecular weight PAHs have not been identified as COPCs for the soil-to-groundwater migration pathway at the OBG adjacent to the RFI study area and these PAHs have not been detected in groundwater samples collected from the OBG in 2008 (Draper Aden 2009a in Appendix G). Based on the limited detection above site-specific SLs, the immobile nature of the high molecular weight PAHs in soil, and lack of groundwater detections at the OBG, PAHs are not considered a potential concern for the soil-to-groundwater pathway in the RFI study area.

5.1.4.7 Explosives - 2,4,6-TNT, 2,6-DNT, and Nitroglycerin

Explosives detected as COPCs in soil have moderate solubility in water. The K_{oc} values for the explosives range from medium low for nitroglycerin, to moderate for 2,6-DNT, and to moderately high for 2,4,6-TNT. Based on their solubility and K_{oc} values, explosives are expected to have some mobility in soil and potential to leach to groundwater if present at sufficiently high concentrations. As presented in the table below, 2,4,6-TNT and nitroglycerin had detected concentrations in one or more samples above their site-specific SLs (Appendix C.7) and the mean soil concentration of 2,3,6-TNT was below its site-specific SL.

COPC	Detected Concentrations (mg/kg)			MDC Above SL	Mean Above SL
	MDC	Mean	Site-Specific SL		
2,4,6-Trinitrotoluene	3	0.23	0.408	Yes (3)	No
2.6-Dinitrotoluene	0.39	N/A	1.5	No	No
Nitroglycerin	21	1.06	0.056	Yes (6)	Yes

Although low levels of explosives have been detected at concentrations above site-specific SLs, based on the limited number of samples above SLs, the mean concentrations being below the site-specific SL with the exception of nitroglycerin, and the lack of explosives detections in groundwater at the OBG (the source area for chemicals in the RFI study area), explosives are not considered a potential concern for the soil-to-groundwater pathway in the RFI study area.

5.2 FATE AND TRANSPORT SUMMARY

Volatilization was not identified as an important fate and transport process in the RFI study area given the identification of one volatile COPC (TCE) in soil for the soil to groundwater migration pathway only. Degradation processes are not expected to be a significant fate and transport process in soil given that lead is the primary COPC. Erosion processes and mass transport of surface soil are expected to be impeded by the presence of thick vegetative cover across the RFI study area. A quantitative evaluation of soil erosion in the RFI study area indicated that minimal

Table 5-1a
Chemical Properties Affecting Fate and Transport
Study Area at SWMU 13 RFI Report
Radford Army Ammunition Plant, Radford, Virginia

Property	Description
Specific Gravity	Specific gravity is the ratio of the density of a chemical to the density of water and its tendency to float (specific gravity <1) or sink (specific gravity >1) in water. Chemicals that are immiscible in water can exist as non-aqueous phase liquids and are referred to as light non-aqueous phase liquid if their specific gravity is less than one, or dense non-aqueous phase liquid if their specific gravity is greater than one.
Water Solubility	Water solubility of a chemical is the mass of chemical that will dissolve in a unit volume of water at a specific temperature. Chemicals with a high solubility tend to remain dissolved in water rather than partition to soil or sediment are less likely to volatilize, and more likely to biodegrade. Chemicals with a low solubility tend to partition to soil or sediment, are more likely to volatilize and less likely to biodegrade.
Vapor Pressure	Vapor pressure of a chemical is how readily it will volatilize to the atmosphere. Volatilization from water is dependent upon vapor pressure and Henry's law constant. Vapor pressures in their pure state range from 0.001 to 760 millimeters mercury (mm Hg) for liquids to less than 1E-10 mm Hg for solids.
Henry's Law Constant	Henry's law constant of a chemical is a measure of how a chemical will partition between air and water at equilibrium. It is the ratio of the vapor pressure to the water solubility (atm-m^3/mole) and can be used to calculate the rate of volatilization of a chemical from water. Chemicals with a high Henry's law constant more readily volatilize from water.
Organic Carbon Partition Coefficient (K_{oc})	K_{oc} is a measure of the tendency for a chemical to be sorbed to the organic fraction of soil and sediment. The lower the K_{oc} values the more leaching potential from soil or sediment to water. Chemicals with a K_{oc} less than 100 milliliters per gram (mL/g) have a high potential to leach from soil or sediment to water, while K_{oc} values in the range of 100 to 500 mL/g indicate a moderate leaching potential.
Octanol-Water Partition Coefficient (Ko_w)	K_{ow} describes the partitioning of an organic chemical between a polar phase (water) and a relatively nonpolar phase (1-octanol). It is equated to the partitioning (sorption) in an aquifer of a chemical between the water and the porous media organic content. A chemical with a high K_{ow} is hydrophobic and may be relatively immobile in an aqueous system but may be mobilized in the presence of an organic solvent.

Table 5-1c
Fate Processes Affecting Organics
Study Area at SWMU 13 RFI Report
Radford Army Ammunition Plant, Radford, Virginia

Process	Description
Sorption	Sorption includes the processes of adsorption and absorption. Adsorption is a mass transfer process where a substance is transferred from a phase to the surface of a medium (e.g. soil or sediment) where it is bounded by chemical or physical forces. Absorption is the partitioning between two phases (Knox et al. 1993). Sorption reactions are either sorbent or solvent-motivated. Sorbent-motived reactions occur when there is an attraction between the sorbent and the solute and the chemical accumulates at the surface due to the affinity of the surface for the chemical. Solvent-motivated reactions occur when the chemical is hydrophobic, such as nonionic organics, where the chemical will accumulate at an interface or partition into a nonionic phase (associate with the organic content of the medium). For nonionic organics, the fraction of organic content (foc) of the subsurface material is the dominant soil characteristic affecting sorption (Knox et al. 1993). Primary indicators of the partitioning of a chemical are the organic carbon water partition coefficient (Koc), soil/water distribution coefficient (Kd), the octanol water partitioning coeffient (Kow), and the calculated retardation factor.
Hydrolosis	Hydrolysis is the degradation process via chemical reactions (oxidation, reduction, hydrolysis) without the participation of organisms. Hydrolysis is a chemical decomposition process that uses water to split chemical bonds of substances. There are two types of hydrolysis, acid and enzymatic. Hydrolysis is limited to chemical that contain hydrolyzable groups and is effected by the contaminants hydrolysis half life.
Volatilization	Volatilization is the process by which a contaminant changes from a liquid phase to a gas phase. This process applies to organic comtaminants migrating from the soil or surface water. Volatile organic chemicals are a class of chemicals that easily evaporate or mix with the atmosphere. The potential volatilization of a chemical is affected by the compounds vapor pressure, solubility, organic carbon partitioning coefficient, and the temperature.
Abiotic Degradation	Abiotic degradation includes degradation processes in which organisms do not participate. Photolysis describes the abiotic degradation process via photochemical reactions such as photooxidation, photomineralisation without the participation of organisms. As described above, hydrolysis is an additional process of abiotic degradation.
Biotic Degradation	Biotic degradations the process in which chemical degradation of a contaminant is aided by soil organisms. Biotic degradation can be either aerobic or anaerobic. The rate of metabolism/cometabolism is affected by the contaminant's biochemical oxygen demand, chemical oxygen demand, degree of halogenation, etc. Reactions include but are not limited to oxidation/reduction and hydrolysis, as described above.

Response to Comments (February 9, 2010)
Comments on the *Draft Study Area at Solid Waste Management Unit 13 RCRA Facility Investigation Report,* Radford Army Ammunition Plant (RFAAP), Virginia, dated July 2009 (RFI Report). Received November 3, 2009.

GENERAL COMMENTS

1. The RFI Report does not present a "hot spot" evaluation to determine whether there are localized areas of contamination that may require further evaluation or possible remediation. Section 1.5.1.1 of the *Final Work Plan Addendum 023 for RCRA Facility Investigation at Solid Waste Management Unit 13 (Work Plan Addendum 023),* dated July 2008, states that additional soil sampling was required to further assess the nature and extent of lead in soil and to "identify any 'hot spot' areas with concentrations above the industrial [Action Level] AL." Section 4.2.3, Lead, of the RFI Report notes that lead was detected above its industrial Regional Screening Level (RSL) (800 milligrams per kilogram [mg/kg]) in six samples at the site, and above the residential RSL (400 mg/kg) in 21 samples at the site. The maximum concentration of lead in surface soil was reported as 8,620 mg/kg in sample 13SB8A and the maximum concentration of lead in subsurface soil was 26,500 mg/kg in sample 13SB11B, 4.5-5 feet. The RFI Report notes that "the majority of the 17 sample locations with lead concentrations above RSLs occur at discrete locations that are along or proximate to the perimeter berm of the [Open Burn Ground] OBG," however, it is unclear whether this area along the berm could be considered a "hot spot." Additionally, since limited soil data from the OBG were considered in this RFI (i.e., results of soil sampling required by the Subpart X Permit); it is unclear whether the lead contamination identified along the perimeter berm extends into the OBG. Revise the RFI Report to present a "hot spot" evaluation to determine any localized areas of contamination that may require further evaluation or remediation.

   Response: The study area itself is a strip of land approximately 40 feet wide located between the New River and an RCRA permitted unit (OBG). The study area cannot be developed since it is located in the 100-year flood plain and the slope of the terrain.

   The study area is not a typical disposal area. The study area itself was not an active area, but rather adjacent to an active area (OBG) and was potentially impacted by activities at the OBG. The original sampling plan was developed for the 1.6 acre area to provide sufficient data to identify any potential widespread elevated lead levels or "hot spots." The results of the investigation did not indicate widespread elevated lead levels or "hot spots." Since the study area was not an active site, "hot spot" areas would not occur within the study area from previous site activities. The maximum concentrations of lead detected in Samples 13SB8A and 13SB11B were collected during the SSP investigation and these concentrations were not replicated in any of the other SSP or RFI samples (181 samples) collected. These would be isolated elevated levels of lead within maximum approximate areas of 2,000 sq ft based on the grid sampling conducted.

   The lead concentrations detected along the berm were at discrete locations (Figures 4-1a and 4-1b) and do not indicate a "hot spot" due to no pattern or discernable distribution, but rather isolated elevated lead levels primarily above the residential screening level. Although these limited elevated lead levels were located proximate to the berm between

samples were proposed, describe implications of this deviation on achieving the investigation objectives. In particular, sample locations where RSL exceedances were reported in surface soil but deeper samples were not collected (e.g., 13SB63A) should be addressed.

Response: The RFI Report will be revised to provide information on actions taken when refusal was encountered at boring locations at depths substantially shallower than anticipated or planned. In general, a soil-digging bar was used to deepen the boring if possible or the boring was offset slightly in attempt to verify conditions or achieve a greater depth, if possible.

Shallow termination depths resulted in approximately 10 percent of the sample locations not having a subsurface sample where originally planned. The slight bias in the number of surface samples relative to subsurface samples is not considered to represent a significant constraint in achieving investigation objectives, given the likely historical release mechanisms from the adjacent OBG (surface release mechanisms rather than subsurface disposal) and low mobility of lead in soil that would tend to bias higher concentrations in surface soil.

4. According to the conceptual site model (CSM) (Figure 6-2), exposure routes associated with sediment and surface water were evaluated qualitatively. However, the qualitative assessment concerning these exposure media was not included in the HHRA. Revise the HHRA to include a detailed qualitative assessment concerning these exposure media as required by the MWP.

   Response: The following text will be added to Section 6.2.1: "Lead concentrations in New River sediment are below the human health residential SL of 400 mg/kg, with the exception of station NR-SED-16 (500 mg/kg) located downstream of the OBG, SWMU 54, and the RFAAP MMA. The mean concentration of lead for each sub-segment sampled and the entire reach sampled was below 400 mg/kg.

   The SWMU 54 RFI/CMS Report (URS 2008b) concluded that attributing lead and other metals detected in sediment samples to a specific source or sources is not possible for the RFI given the complex transient flow and depositional patterns in the river, and therefore, it is recommended that these data be used holistically as part of any overall evaluations of the facility and potential receptors conducted for the RCRA Corrective Action Permit.

   During the SWMU 54 RFI/CMS investigation, it was established that lead tends to partition to sediment rather than remain in surface water: therefore, the risk to human health receptors is considered minimal with regard to exposure to lead in surface water."

5. Section 6.4, Risk Characterization: This section refers to the default age-dependant adjustment factors that appear in USEPA 2005; however, a specific description of how risks were calculated for carcinogens that act via a mutagenic mode of action (MOA) should be included in the RFI (either in Section 6 or in Appendix E) to ensure that the RFI contains sufficient information to remain a stand-alone document. For the SWMU 13 Study Area, these compounds include benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenz(a,h)anthracene. It is noted that Appendix E.3 contains

this contamination. Figures 4-2a and 4-2b, Extent of Organic COPCs in Soil, appear to show that the western and southern extents of this contamination have not been defined. No samples west or south of sample 13SB7A, which reported a benzo(a)pyrene exceedance, were analyzed for SVOCs. Please revise Section 4.2.8 to describe the extent of SVOC contamination at the site, and indicate whether the extent of SVOC contamination has been evaluated sufficiently in consideration of the data gap mentioned above.

Response: As stated in the response to comments (dated 6/20/2008) for the work plan (Comment #5), the selected locations reflect the objectives of verifying previous results, providing additional spatial data across the site to characterize site conditions, and providing sufficient data to characterize mean concentrations for risk assessment, while recognizing that lead will be used as the primary indicator to evaluate impacts from historical open burning ground activities and delineate the nature and extent of contamination." The calculated risk associated with the site did not indicate the need for further assessment on the basis of human health. In addition, lead was used as the primary indicator to evaluate impacts from the open burning ground and was sufficiently characterized for the site.

9. **Figure 4-2b, Extent of Organic COPCs in Soil** It does not appear that the extent of nitroglycerin in soil has been evaluated sufficiently. Sample 13SB13C detected nitroglycerin above the industrial RSL, but no samples were analyzed for this constituent east of this location, or at a depth greater than 6 feet below grade. Please revise the RFI Report to address this data gap.

   Response: As stated in the response to comments (dated 6/20/2008) for the work plan (Comment #5), the selected locations reflect the objectives of verifying previous results, providing additional spatial data across the site to characterize site conditions, and providing sufficient data to characterize mean concentrations for risk assessment, while recognizing that lead will be used as the primary indicator to evaluate impacts from historical open burning ground activities and delineate the nature and extent of contamination." The calculated risk associated with the site did not indicate the need for further assessment on the basis of human health. In addition, lead was used as the primary indicator to evaluate impacts from the open burning ground and was sufficiently characterized for the site.

10. **Section 5.1.4, Leaching of Chemicals From Soil to Groundwater, Page 5-3 and Page 5-4:** The individual evaluations for several of the contaminants of potential concern state that many of the contaminants (antimony, lead, thallium, polynuclear aromatic hydrocarbons, nitroglycerin) have not been identified as COPCs for the soil-to-groundwater migration pathway at the OBG adjacent to the RFI study area. However, it does not appear that site-specific data from the current RFI for the study area adjacent to the OBG were evaluated with respect to soil-to-groundwater migration screening levels (SSLs). EPA's Regional Screening Level Table includes Protection of Groundwater SSLs that can be used to evaluate the potential for leaching of chemicals to groundwater. Please revise the RFI Report to screen detected concentrations in soil against the Protection of Groundwater Soil Screening Levels. If exceedances are identified, evaluation of groundwater within the RFI study area may be warranted.

evaluate all metals in surface soil except for manganese. Further, based on the nature of activities conducted at SWMU 13 it is entirely possible that manganese found within the study area is site-related as the study area lies between the perimeter berm of the OBG and the north bank of the New River. While a berm is present to prevent runoff from the OBG into New River, combustion products could have migrated via air over the berm, deposited onto the soil, and subsequently entered New River via runoff; note these transport mechanisms were highlighted in Section 6.2.1 Conceptual Site Model/Receptor Characterization, page 6-4. Manganese is released into the environment from various sources including open burning (e.g.., fossil fuel combustion) (Agency for Toxic Substances & Disease Registry [ATSDR] 2009: http://www.atsdr.cdc.gov/toxprofiles/tp151.html, Toxicological Profile for Manganese). Please revise the HHRA to explain why the background data from SWMU 54 is more relevant to use when assessing manganese in total soil rather than basing conclusions on the facility-wide background data, which was applied to the rest of the metals in surface and total soil. Further, include a qualitative evaluation of manganese in Section 6.6 (Uncertainty Analysis) to explain the impacts of using SWMU 54 data over the facility-wide data for manganese in total soil.

Response: As presented in previous reports (SWMU 54, SWMU 45, SWMU 38, etc.), total manganese concentration in the alluvium tend to be higher than other soil on the plant. The manganese concentrations from SWMU 54 in the area located outside the fence, which was not impacted by previous activities at the site, were used in this comparison since this area is similar to the study area and located slightly downstream the study area. The elevated manganese concentrations are considered to be geologic in nature rather than site related.

13. **Section 6.6.4, Toxicological Data, Pages 6-16 and 6-17:** Section 6.6.4 indicates that provisional toxicity values were used for aluminum, antimony, arsenic, carbazole, cobalt, iron, thallium, vanadium and nitroglycerin. This section further states that some detected constituents (carbazole, dibenzofuran, and dimethylphthalate) do not have Regional RSLs and that provisional/surrogate toxicity values were not available for these COPCs with the exception of carbazole. For completeness, please revise the HHRA to discuss the appropriateness of using the provisional toxicity value for carbazole, provide the value and the source of the value (e.g., Human Health Affects Summary Table [HEAST]).

    Response: A discussion of the appropriateness of using a provisional value is discussed in the third to the last paragraph of Section 6.6.4. The second to the last sentence of the second to the last paragraph will be revised as follows: "Provisional/surrogate toxicity values were not available for these COCPs with the exception of carbazole for which a Human Health Affects Summary Table (HEAST) value from the 1997 table was used."

14. **Appendix E, Human Health Risk Assessment, Tables E.1-2.1 through E.1-2.3:** Please ensure these tables are revised to use the April 2009 RSLs or explain the impact of using an older version in the uncertainty analysis. Also, revise the footnotes of Tables E.1-2.1 and E.1-2.2 to clarify that the screening values for dioxins/furans are based on toxicity relative to 2,3,7,8-TCDD. While this process was described in Section 6.1.1, Data Summary, it would be helpful to provide a footnote in the aforementioned tables to clarify the screening process concerning dioxins/furans.

18. **Section 7.6.2, Dose Rate Modeling Approach, Page 7-8:** The table in this section summarizes the chemicals which either had only NOAEL HQs above 1 or NOAEL and LOAEL HQs above 1 per receptor. One error was identified when the table was compared to Tables F.2-14 through F.2-23. The list of chemicals for the American Robin, which had a NOAEL above 1.0 did not include 2, 4, 6-Trinitroluene. Please revise this table accordingly.

    Response: Table will be revised to include 2,4,6-trinitrotoluene for the American Robin for an HQ above 1 for NOAEL only.

19. **Section 7.7, Risk Management – Scientific Management Decision Point (SMDP), Italicized Conclusion, Page 7-9:** The SMDP states that "Although metal concentrations in plants were above the screening levels, indications of chemical vegetative stress were not observed at the site." The lack of observable chemical vegetative stress is insufficient grounds for concluding no risk to the plant community. For example, it is not known if the local plant community shows a response in terms of lower species diversity, reduced growth, or other more subtle responses that might be observable when compared to an unimpacted reference location. Please discuss in the uncertainty section the limitations of the current conclusion on the lack of risk to the plant community. This additional information will help support risk management decision process.

    Response: The following text will be added to Section 7.8.3: "The qualitative nature of the conclusion of lack of risk to the plant community based on the lack of indicator of chemical vegetative stress and lush vegetation present at the site creates uncertainty since it is not known that if the local plant community shows a response in terms of lower species diversity, reduced growth, or other more subtle responses that might be observable when compared to an unimpacted reference location."

20. **Section 7.8, Exposure and risk uncertainty analysis, Page 7-9 and 7-10:** This section should be expanded to address issues associated with (a) the potential for additive toxic effects of exposure by wildlife receptors to site-related chemicals, (b) the qualitative nature of the evaluation of risk to the plant community, and (c) any concerns associated with listed plant species.

    Response: For part (a): The following text will be added to Section 7.8.6: "An HQ of less than one indicates that the contaminant alone is unlikely to cause adverse ecological effects. The potential for risk increases as the HQ increases above one. However, this result should be considered in the context of other characteristic of the exposure area. In addition, it should be noted that the calculation of chemical specific HQs does not account for multiple chemicals acting through the same exposure mechanism."

    For part (b): See Comment #19.

    For part (c): See Comment #16.

Response to EPA responses to RTCs SWMU 13 RFI.PDF

April 29, 2010

Response to EPA/DEQ RTCs (Received via e-mail March 29, 2010) to Responses to Comments (Original Responses dated Feb 10, 2010) for Study Area at SWMU 13 RFI Report (July 2009)

1. EPA and VADEQ disagree that no hot spots for lead are present at SWMU 13. Two sample locations show lead concentrations that are substantially higher than lead levels reported in the remaining SWMU 13 samples. Acute risks associated with hot spot exposure should be evaluated, and to this end, EPA performed a risk analysis of these two areas. The Agency concludes that contact with conservatively drawn exposure areas of SWMU 13 is not expected to pose short term risks. However, in consideration of the substantially elevated lead result of 26,500 mg/kg for sample 13SB11B, institutional controls will be required to prevent future digging at this SWMU.

> **Response:** The last sentences of the Executive Summary and Section 8.0 will be revised as follows: "Based on the results of the RFI, HHRA, and SLERA, no further action beyond the implementation of institutional controls to prevent future digging at the RFI study area is recommended.
>
> The following text will also be added to the Executive Summary and Section 8: "Institutional controls are being implemented at the RFI study area at SWMU 13 within the boundaries depicted on Figure 1-2. The objective of the ICs is to prevent future digging at the site. Specifically this site has been incorporated into plant management manual to ensure long-term protection of human health and the environment. The management manual provides for advance notice, assessment and approval of intrusive work that may occur within the plant with a general digging prohibition at sites such as this. In the event the property is transferred or leased, equivalent ICs will be put into terms and conditions of the deed or lease, which are no less restrictive than the IC objectives described above. Furthermore, the transferee or lessee will be responsible for ensuring IC compliance by any future users. However, the Army acknowledges the responsibility for all original liability under CERCLA and its right and responsibility to enforce ICs."

2. The data identified in this comment (1997 study) should be incorporated in the conceptual/mass balance model discussion of soil concentrations left in place and ramifications to river sediment concentrations, etc. How does this lead concentration compare to analyses from other nearby locations?

> **Response:** Prior to the SSP/RFI, historical soil analytical data (1997 study) were considered screening level data and excluded from the risk assessment given the age of the data, the lack of available data validation reports/information, the lack of coordinates to accurately locate the samples, and the availability of sufficient newer validated sediment data to more appropriately characterize conditions. In addition due to the transient nature of the river, the most recent sediment concentrations (SWMU 54 RFI/CMS Report 2008) would be more appropriate to characterize sediment conditions within the river. Per the EPA partnering meeting (February 2010), a mass balance analysis was conducted for the site utilizing annual runoff estimates and estimates of runoff for a 10-year storm event. See calculations in Attachment 1 (Calculations will be provided in an Appendix within the RFI report). The following summary of the results will be added to Section 4.
>
> "Although previous sediment sampling results (Section 2.2.5) did not indicate the site had historically significantly affected the New River based on the detected lead concentrations at the study area, an assessment of the study area as a potential future source of lead loading in the New River was conducted. The site area assessed is limited to the 1.6 acre study area. The presence of

the OBG berm along the northern edge of the study area prevents runoff from adjacent areas to the north from entering the study area (Section 2.1.3). Soil losses were calculated as described below.

The Revised Universal Soil Loss Equation (RUSLE) is an erosion model predicting longtime average annual soil loss resulting from raindrop splash and runoff. As presented in Calculation #1, the potential average annual soil loss for the site is 0.9 tons containing a total of 0.26 kg of lead per year. Based on the average flow of the river (3,258 ft^3/sec) and the minimal mass of lead potentially transported to the river over the course of a year, the potential soil loss is not considered to present a significant future risk to the New River.

In addition to calculating potential annual soil loss for the site, soil losses were calculated for an individual storm event using a method called the Modified Universal Soil Loss Equation (MUSLE), which allows for the calculation of sediment yields for individual storm events. As presented in Calculation #2, a potential sediment yield for a 10-year storm was calculated for the site assuming all eroded soil from the site was discharged to the river (i.e., no delivery ratio was used). A 10-year storm resulted in a potential soil loss for the site of 0.3 tons containing a total of 0.09 kg of lead per storm event. Considering mixing of the runoff from the storm event (peak flow of 4.35 ft^3/sec) and the average flow of the New River (3,258 ft^3/sec), as well as, the minimal mass of lead potentially transported to the river via soil loss, the potential soil loss is not considered to present a significant future risk to the New River.

Based on the previous sediment sampling results and the results of the annual and 10-year storm event soil loss assessments, potential RFI study area related releases to the New River are not considered to pose current or future significant risk to the river."

6. The response appears to be adequate and should be included in the report.

Response: The response will be included in Section 6.0 of the report.

8 and 9. Figures 4-1 and 4-2 do not support the initial assumption that lead is the primary indicator for contamination at the study area. 12/15 samples exceeded residential screening levels with 2 above industrial. This is a much higher percentage of hits compared with the lead samples. In addition 8 of the 12 exceedances were at locations where lead was below screening levels.

Response: Per the conference call (4/14/2010), it was agreed that: Although PAHs and nitroglycerin were detected in soil at concentrations above screening levels, PAHs and nitroglycerin were not identified as risk or hazard drivers in the human health and ecological risk assessments. This information will be added to Section 4.

10. Even though groundwater monitoring is being conducted as part of the OBG permit, SSLs are still appropriate for the evaluation of potential soil impact over the subject study area. The soil to groundwater pathway should still be evaluated as part of the overall assessment of the contaminated soils.

Response: Please see revised Section 5 (Attachment 2) and associated attachments (Attachment 3 - SESOIL Output and Attachment 4 - SSL Calculations. Attachments 3 and 4 will be included in appendices within the RFI report.

Attachment 1

Soil Loss Calculations

Calculation #1 - Annual Soil Loss

Revised Universal Soil Loss Equation (RUSLE)

$A = R \cdot K \cdot LS \cdot C \cdot P$
$= 132 \cdot 0.24 \cdot 4.4 \cdot 0.004 \cdot 1 = 0.56$ tons/acre/year

A = Loss per acre per year (tons per acre per year)

R = Rainfall value = 132 (from Figure 2-1 - USDA 1997 – Pulaski County)

K = Soil Erodibility Factor = 0.24 (Wheeling Sandy Loam)

LS = factor for horizontal length of slope and slope gradient = $0.77 \cdot 5.7 = 4.4$

$L = (\lambda/72.6)^m = 0.77$

λ = slope length= 43 feet

m= slope length factor = 0.5 (slope > 5%)

$S = (16.8 \sin(\Theta))-0.5 = 5.7$

Θ= slope angle = 21.8 degrees

C = factor for planned cover = 0.004 (from Table 11 - USDA 1978 – 70-45% cover trees and undergrowth, 85-75% duff coverage)

P = factor for management options = 1 (default)

Site Soil Loss = A·Site Area = 0.56 tons/acre/year·1.6 acres = 0.9 tons/year

Total Lead In Soil = 0.9 tons · 314 mg/kg average lead in surface soil · 2000 lbs/ton · 1kg/2.2 lbs · 1E-06 kg/mg
= 0.26 kg of lead

Calculation #2 - Single Event Soil Loss

Modified Universal Soil Loss Equation (MUSLE)

$Y = 95(Q \cdot q)^{0.56}\ K \cdot LS \cdot C \cdot P$
$= 95(0.147 \cdot 4.35)^{0.56}\ 0.24 \cdot 4.4 \cdot 0.004 \cdot 1 = 0.3$ tons of soil

Y = single storm sediment yield in tons

Q = storm runoff volume = $[(P-0.2S)^2/(P+0.8S)]$ (inches)
= 1.1 inches = 0.092 ft = 0.092 ft · 1.6 acres = 0.147 acre-ft
P = Rainfall Depth = 3.63 inches (Virginia Department on Conservation and Recreation - 10 Year Storm 24 Hour for Pulaski County)
S = 1000/CN-10 = 1000/70-10 = 4.3
CN = SCS Curve Number = 70 (Soil Group C – Forest Good Condition)

q = peak flow = $C \cdot I \cdot A$
$= 0.4 \cdot 6.8 \cdot 1.6 = 4.35\ ft^3/sec$
C = Manning's Runoff Coefficient for Sheet Flow = 0.4 (for woods – light underbrush)
I = Rainfall Intensity = 6.8 in/hour (Roanoke County IDF Curve – Duration 5 min due length of overland flow and slope)
A = Drainage Area = 1.6 acres

K = Soil Erodibility Factor = 0.24 (Wheeling Sandy Loam)

LS = factor for horizontal length of slope and slope gradient = 0.77·5.7 = 4.4
L = $(\lambda/72.6)^m$ = 0.77
λ = slope length= 43 feet
m= slope length factor = 0.5 (slope > 5%)
S = $(16.8 \sin(\Theta))-0.5$ = 5.7
Θ= slope angle = 21.8 degrees

C = factor for planned cover = 0.004 (from Table 11 - USDA 1978 – 70-45% cover trees and undergrowth, 85-75% duff coverage)

P = factor for management options = 1 (default)

Lead In Soil = 0.3 tons · 314 mg/kg average lead in surface soil · 2000 lbs/ton · 1kg/2.2 lbs · 1E-06 kg/mg
= 0.09 kg of lead

Attachment 2

Revised Section 5

5.0 FATE AND TRANSPORT ASSESSMENT

This section discusses the fate and transport of site-related COPCs. Primary fate and transport mechanisms occurring at the site are discussed. The objective of the fate and transport analysis is to identify the primary mechanisms affecting the distribution and migration of COPCs and their ultimate fate. COPCs identified at the site are summarized in the following table.

Site COPCs from Nature and Extent Assessment

Soil – Human Health		Soil to Groundwater SL DAF 10 (Section 5.1.4)	
Antimony	Benzo(a)anthracene	Iron	Benzo(a)pyrene
Iron	Benzo(a)pyrene	Lead*	Benzo(b)fluoranthene
Lead	Benzo(b)fluoranthene	Thallium	2,4,6-Trinitrotoluene (TNT)
Thallium	Dibenz(a,h)anthracene	Trichloroethene (TCE)	2,6-Dinitrotoluene (DNT)
Nitroglycerin		Benzo(a)anthracene	Nitroglycerin

Note: *Although lead does not have a risk based SL it is included in the evaluation due to the nature of the site.

The potential for transport of chemicals in environmental media is largely controlled by the physiochemical properties of the chemicals and the matrix through which they travel or migrate. Table 5-1a describes the physiochemical properties of chemicals that affect their fate in environmental media. Table 5-1b describes the fate processes affecting metals including: ion exchange, chemical speciation, and oxidation-reduction potential. Table 5-1c describes the fate processes affecting organic chemicals including: sorption, volatilization, hydrolysis, and abiotic and biotic degradation. Chemicals can be transported with little attenuation or retardation due to these fate processes or they can be delayed or transformed so that minimal migration occurs. The physical and chemical properties of organic COPCs detected in soil are summarized in Table 5-2.

Primary fate and transport mechanisms for COPCs potentially present at the site include the following:

- Volatilization of chemicals from soil;
- Erosion of particulate-bound chemicals from soil;
- Degradation of chemicals in soil;
- Leaching of chemicals from soil with infiltrating water; and
- Transport of chemicals with groundwater flow.

Fate and transport processes for site media are discussed in the following sections.

5.1 FATE AND TRANSPORT - SOIL

Fate and transport processes for soil are discussed in the following sections including volatilization, erosion and mass transport, and degradation of chemicals in soil, and leaching of chemical from soil with infiltrating water.

5.1.1 Volatilization

Volatilization can significantly affect the distribution of a chemical in the environment. This process will result in the mass and concentration of a chemical in soil as the chemical volatilizes to soil gas and ultimately discharges to the atmosphere. Volatilization reactions are most significant in surface soil that is in direct (or near-direct) contact with the atmosphere. Chemical volatility is typically quantified by a chemical's Henry's constant, which may be calculated from the chemical's vapor pressure, molecular weight, and solubility. The lower the Henry's constant,

the less volatile the chemical. Values of Henry's constant for soil COPCs are summarized in Table 5-2.

One VOC (TCE) and one SVOC (naphthalene) with Henry's constants less than 0.1 were identified as COPCs for the soil-to-groundwater migration pathway based on detections in one or more samples above calculated site-specific SLs (Section 5.1.4). Low concentrations of these COPCs have been detected in soil and therefore, volatilization is not expected to be a significant influence on the fate of this compound in soil. Other COPCs at the site are characterized by low Henry's constants (i.e., < 0.01) and are not considered highly volatile, and therefore, volatilization is not expected to be a significant influence on the fate of these compounds at the site.

5.1.2 Erosion Processes in Soil

Erosion processes can substantially affect the distribution of soil-bound particulates in the environment and thus influence the distribution of constituents in soil. High winds can scour fine particles from the soil surface and redistribute these particles downwind. Mass transport from surface water runoff during heavy precipitation events can also scour fine soil particles from surface soil, eventually depositing the particles during sedimentation downstream. As presented in Section 4.4, this potential migration pathway is impeded by the presence of significant vegetation in the RFI study area. Section 4.4 presents a quantitative evaluation of soil erosion in the RFI study area with respect to potential lead transport to the adjacent New River by erosion processes. The results of this evaluation indicated that minimal mass of lead would be potentially transported to the river by erosion processes and the potential soil loss is not considered a significant future risk to the New River.

5.1.3 Degradation of Chemicals in Soil

Many organic chemicals that are found in the environment are subject to naturally occurring biotic (biologically based) and abiotic (non-biologically based) transformation reactions. These reactions result in degradation of the chemical. Biodegradation reactions can occur under aerobic (in the presence of oxygen) and anaerobic (in the absence of oxygen) conditions. During biodegradation, naturally occurring microorganisms in the subsurface transform a chemical to another state as a direct or indirect consequence of their metabolic processes. In many cases, biodegradation reactions break down organic chemicals to less toxic forms.

Several naturally occurring abiotic reactions can significantly affect the fate of chemicals in the environment. Common abiotic reactions include photodegradation and hydrolysis. Photodegradation is the process of decomposition of a chemical upon exposure to radiant energy such as the action of light, and is most significant to chemicals in surface soil that are in direct contact with sunlight. Hydrolysis is the degradation reaction of the chemical with components of water (e.g., hydroxyl and hydronium ions) and is therefore most important in saturated environments.

5.1.3.1 Metals

Metal COPCs, such as antimony, iron, lead, and thallium will not be significantly influenced by degradation processes in soil.

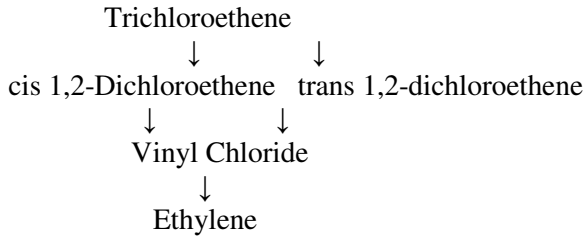
5.1.3.2 VOCs

VOCs were detected low concentrations in soil at the site. The VOC COPC identified for the soil-to-groundwater migration pathway was TCE.

TCE: TCE was detected in 3 of 14 samples at low level concentrations. TCE is resistant to aerobic degradation in soil although biodegradation may proceed co-metabolically. Under anaerobic conditions, TCE is slowly biodegraded through reductive dechlorination, with the

extent and rate of degradation dependant on the degree of the reducing environment. The reductive dechlorination pathway for TCE is shown below. Vinyl chloride is an intermediate degradation by product in this pathway as shown below; this compound has not been detected at the site. Ethylene is an end- product of this degradation process.

TCE Degradation Pathway – Reductive Dechlorination



5.1.3.3 SVOCs

SVOCs identified as COPCs in soil at the site consisted of high molecular weight PAH compounds benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, and naphthalene (soil to groundwater). Microbial metabolism is the primary process for degradation of PAHs in soil. Hydrolysis, oxidation reduction, and photodegradation are not considered important processes for the degradation of PAHs in soil. The higher molecular weight PAHs that are COPCs at the site will tend to have lower rates and degrees of degradation than middle to lower molecular weight PAHs. The rate and extent of biodegradation of PAHs in soil is also influenced by soil properties such as organic content, structure, particle size, pH, temperature, and oxygen content, and the characteristics of microbial populations in the soil. The presence of metals in soil that are toxic to microorganisms will impede degradation (ATSDR 1995).

Experimentally reported half-lives for high molecular weight PAHs in soil are typically in the range of 1 to 1.5 years but will vary depending soil and site characteristics. Specific information on the relative degradation rates of PAHs in site soil is not available; it is possible that some degradation of PAHs has occurred at the site given the low concentrations of high molecular weight compounds detected. The presence of lead in soil is not expected to have an adverse impact on PAH degradation given the low-levels or absence of detectable levels of PAHs in soil.

5.1.3.4 Explosives – 2,4,6-TNT, 2,6-DNT, and Nitroglycerin

Explosive compounds identified as COPCs in soil include: 2,4,6-TNT (soil to groundwater only), 2,6-DNT (soil to groundwater only), and nitroglycerin.

2,4,6-TNT transformation generally occurs by sequential reduction of nitro groups to amino groups. 2,4,6-TNT is readily reduced in soil under anaerobic conditions, with sequential microbial transformations producing 4ADNT and 2ADNT and other degradation by products. Recent studies indicate that 2,4,6-TNT can be degraded under aerobic conditions with production of amino DNT and other degradation byproducts. There is some data to suggest that 2,4,6-TNT in uppermost layers of surface soil may be photolyzed to trinitrobenzene and trinitrobenzaldehyde (HSDB 2009). The half lives of 2,4,6-TNT in soil have been reported as ranging from 4 to 10 years, with a microbial oxidative decomposition rate of 0.017 to 0.05 percent per day (Cataldo et al 1989).

2,6-DNT is an impurity of TNT and may undergo some degradation in soil by microorganisms with a reduction of the nitro group to form amino groups including 4-amino-2-nitrotoluene and 2-amino-4-nitrotoluene. DNT may undergo photolysis in uppermost surface soil layers based on a

rapid rate of photolysis observed in water. DNT is not expected to undergo hydrolysis in soil due to a lack of functional hydrolyzable functional groups (HSDB 2009).

Nitroglycerin undergoes rapid biodegradation using batch reactors and digestors but its rate of biodegradation in soil is unknown. Hydrolysis of nitroglycerin in soil may be important under alkaline conditions but is not expected to be an operable degradation process at the site due to the neutral pH of the soil (HSDB 2009).

5.1.4 Leaching of Chemicals from Soil to Groundwater

Chemicals in soil have the potential to migrate to greater depths with infiltrating water. As precipitation infiltrates, chemicals may be leached from the soil and carried to greater depths and potentially to groundwater. Table 5-3 summarizes the screening results for soil data including: constituents detected, minimum and maximum concentrations detected, number of detections, number of samples, and number of samples above risk-based soil to groundwater screening levels (SLs) and background (inorganics only) to evaluate the potential migration of chemicals in soil to groundwater. Risk-based SLs were obtained from the April 2009 Regional Screening table (USEPA 2009) and utilize a dilution attenuation factor (DAF) 10. A DAF 10 was used for the site due to the lack of an infinite source, the depth to groundwater, and the attenuation of chemicals due to soil types. The screening identified the following chemicals with detected concentrations above their generic DAF 10 SLs and background point estimates (inorganics only):

Chemical	# Detects/ # Samples	# Detects Above SL
Iron	32/32	2
Thallium	32/32	1
Trichloroethene	3/14	3
Benzo(a)anthracene	25/32	2
Benzo(a)pyrene	29/32	12
Benzo(b)fluoranthene	29/32	1
Naphthalene	10/32	4
2,4,6-Trinitrotoluene	5/32	5
2.6-Dinitrotoluene	1/32	1
Nitroglycerin	6/32	6

Factors affecting leaching are discussed below followed by assessments for soil to groundwater COPCs identified summarized above with concentrations above SLs. The degree to which a chemical is leached is strongly influenced by the chemical's tendency to partition to the solid or aqueous phases, which is largely a function of the chemical's solubility and particle affinity.

Water Solubility

Water solubility of a chemical is the mass of chemical that will dissolve in a unit volume of water at a specific temperature. Chemicals with a high solubility can often be readily dissolved in water and therefore are susceptible to being mobilized from the soil matrix with infiltrating water and migrating downward to groundwater. Chemicals with a low solubility tend to partition to soil.

The solubility of organic chemicals is typically a function of the hydrophobic nature of the chemical. Many organic chemicals are non-polar and therefore do not dissolve readily into water, which is a polar solution. The organic COPCs identified in soil at the site (PAHs and nitroglycerin) have low to moderate water solubility. Water solubility data for COPCs are summarized in Table 5-2.

Adsorption

The aqueous concentration of chemicals in soil systems can also be substantially influenced by adsorption reaction to the soil matrix. Adsorption is the ability of a substance to bind to the surface of soil particles from reactions that occur between the chemical and the soil particle surface. Organic compounds are frequently non-polar, and therefore, tend to interact with organic matter commonly associated with the soil matrix. The tendency for a chemical to be adsorbed to the organic fraction of soil (or sediment) can be measured by the chemical's organic carbon partition coefficient (K_{oc}). The lower the K_{oc} values the more leaching potential from soil to water as summarized below. Organic compounds with a K_{oc} less than 100 liters per kilogram (L/kg) have a high potential to leach from soil to water such as TCE. Progressively higher values of K_{oc} indicate lower leaching potential. Organic compounds with K_{oc} values in the range of 1E+04 to 1E+06 L/kg, such as the high molecular weight PAHs, are generally immobile or nearly immobile in soil. Values of K_{oc} for COPCs are summarized in Table 5-2.

Site-specific distribution coefficients (K_d) can be estimated for each organic COPC, as the product of the K_{oc} of the chemical and the fraction of the organic carbon (f_{oc}) in the soil matrix. The distribution coefficient is a measure of the ratio of chemical mass that partitions to the solid and liquid phases under equilibrium conditions. The fraction of organic carbon measured in site soil ranged from 0.47 to 1.5% based on physical data collected at the site. Calculated K_d values are presented in Table 5-2. Based on solubility, K_{oc} and K_d values, the high molecular weight PAHs are expected to be immobile in soil while the nitroglycerin is expected to have low to moderate mobility.

5.1.4.1 Development of Site Specific Soil-to-Groundwater SLs

Site-specific soil-to-groundwater SLs have been calculated for organic chemicals to evaluate the potential for leaching of soil to groundwater COPCs to groundwater at concentrations of potential concern. EPA equation B-13 included in Appendix B of the Supplemental Guidance for Developing SSLs for Superfund Site (USEPA 2002) has been modified to incorporate the following site-specific parameter data for each disposal area as summarized in the following table.

$$C_t = C_w\left(K_{oc} * f_{oc} + \frac{\theta_a + \theta_w * H'}{\rho_b}\right) \qquad \text{Equation } 5-1$$

where:

Parameter	Definition (Units)	Value	Source
DAF	Dilution Attenuation Factor (unitless)	10	DAF Value
C_t	Screening level in soil, (mg/kg)	Calculated Using Equation 5-1	USEPA 2002c
C_w	Target leachate concentration (mg/L) x DAF	Chemical Specific T-RSL DAF (10)	USEPA April 2009 RSL Table
K_{oc}	Soil organic carbon-water partition coefficient (L/kg)	Chemical Specific	RAIS (2007)
f_{oc}	Organic carbon content of soil, (kg/kg)	0.01 (1%)	Average Concentration of TOC from Table 2-1

Parameter	Definition (Units)	Value	Source
θ_w	Water-filled soil porosity, (L_{water}/L_{soil})	0.3	Default (USEPA 2002)
θ_a	Air-filled soil porosity, (L_{air}/L_{soil}), (η - θ_w)	0.09	Calculated based on Average of RFI Physical Soil Results
ρ_b	Dry soil bulk density	1.61 kg/L	Average of RFI Physical Soil Test Results (Table 2-1)
H'	Henry's law constant	Chemical-specific	RAIS (2007)

Notes: RAIS = Risk Assessment Information System – Chemical Specific Factors at http://rais.ornl.gov/

Detailed SL calculations are presented in Appendix C.7. The leaching potential of COPCs is evaluated in the following based on the chemical properties of the COPCs, comparisons of the site data to SLs, and an evaluation of groundwater data from the OBG (source of chemicals in the RFI Study Area).

5.1.4.2 Iron

Iron naturally occurs at appreciable levels in soil at RFAAP with a background point estimate of 50,962 mg/kg. Adsorption of iron to soil is dependent on pH and organic matter, with an increase in either of these parameters resulting in increased adsorption. Mobility is also influenced by oxidation reduction potential, with iron becoming more mobile under reducing conditions than oxidizing conditions (HSDB 2009). Soil pH values are in the range of 5 to 7 and will likely reduce the mobility of iron along with the presence of appreciable organic matter in surface and near surface soil (3.5%). Site data indicate that iron concentrations detected above the SL and background point estimate are limited to surface or near surface intervals in 2 of 32 samples collected from the RFI study area. In addition as presented in Section 6.4.2, background statistical evaluations identified iron as consistently below background. Based on the background evaluation, near neutral pH of site soil, and appreciable organic matter in surface and near surface soil, iron is not considered a potential concern for the soil-to-groundwater pathway in the RFI study area.

5.1.4.3 Lead

Although lead does not have a risk-based soil to groundwater SL (USEPA 2009), due to the nature of the RFI study area the migration of lead from soil to groundwater was assessed utilizing the SESOIL model. The SESOIL unsaturated zone fate-and-transport model was used to evaluate the mobility of lead in soil within the RFI study area (Environmental Software Consultants, Inc., 2008). SESOIL is a one-dimensional vertical fate-and-transport screening level model for the unsaturated zone. It simulates chemical fate-and-transport based on diffusion, adsorption, volatilization, biodegradation, and hydrolysis. The model is designed to simultaneously model both chemical and soil water transport in the soil column under natural seasonal climatic variations.

Lead mass loading parameters for this assessment assumed a lead concentration equal to the mean concentration detected in site soil (414 milligram per kilogram) across the entire 1.6 study area for a depth interval of 0 to 5.5 ft. Local climate data for Radford, Virginia and site-specific physical soil data were also incorporated into the assessment.

The results of the SESOIL assessment indicated that over the 30-year period modeled, lead is immobile in site soil, with 99.87 percent of the lead mass remaining adsorbed to soil, with the remaining mass present in the soil air phase. Over the 30-year modeled period, the net change in

lead depth in the soil column is 1.2 centimeters or less than 0.5 inches. It is therefore concluded from the assessment that substantial vertical migration of lead in soil is unlikely within the evaluated study area.

As the model demonstrates, most lead is retained strongly in soil and very little leaches to groundwater. Lead has not been identified as a COPC for the soil-to-groundwater migration pathway at the OBG adjacent to the RFI study area and lead was not detected in groundwater samples collected from the OBG in 2008 (Draper Aden 2009a in Appendix G). Based on the results of the SESOIL model, the immobile nature of lead in soil and lack of groundwater detections at the OBG (the source area for the chemicals at the RFI study area), lead is not considered a potential concern for the soil-to-groundwater pathway in the RFI study area.

5.1.4.4 Thallium

Thallium commonly occurs as salts in soils but can be immobilized by clays and retained in soil by aluminum, and iron oxides, and organic matter, which are present at appreciable levels in site soil (HSDB 2009). Site data indicate the thallium concentration detected above the SL and background point estimate is limited to the surface interval in 1 of 32 samples collected from the RFI study area. Thallium has not been identified as a COPC for the soil-to-groundwater migration pathway at the OBG adjacent to the RFI study area and thallium was not detected in groundwater samples collected from the OBG in 2008 (Draper Aden 2009a in Appendix G). In addition as presented in Section 6.4.2, background statistical evaluations identified thallium as consistently below background. Based on the above information, thallium is not considered a potential concern for the soil-to-groundwater pathway in the RFI study area.

5.1.4.5 VOCs - TCE

TCE was identified as a COPC for the soil-to-groundwater migration pathway. This compound has a high solubility, lower K_{oc} values, and moderate mobility in subsurface (Table 5-2). As presented in the table below, the detected concentrations of TCE in soil above site-specific SLs (Appendix C.7) was limited to two samples above the site-specific SL and the mean soil concentration was below the site-specific SL.

	Detected Concentrations (mg/kg)				
COPC	MDC	Mean	Site-Specific SL	MDC Above SL	Mean Above SL
Trichloroethene	0.057	0.0073	0.015	Yes (2)	No

Based on the limited detections above site-specific SL, the low levels of these detections, and the mean concentrations below the site-specific SL, TCE is not considered a potential concern for the soil-to-groundwater pathway in the RFI study area.

5.1.4.6 PAHs

Several high molecular weight PAH compounds were identified as COPCs for the soil-to-groundwater migration pathway at the RFI study area. As presented in the table below, the detected concentration of PAHs in soil above site-specific SLs (Appendix C.7) was limited to one sample slightly above the site-specific SL for benzo(a)pyrene and the mean soil concentration was below the site-specific SL.

COPC	Detected Concentrations (mg/kg)			MDC Above SL	Mean Above SL
	MDC	Mean	Site-Specific SL		
Benzo(a)anthracene	0.480	0.056	0.67	No	No
Benzo(a)pyrene	0.290	0.047	0.23	Yes (1)	No
Benzo(b)fluoranthene	0.630	0.086	2.3	No	No
Naphthalene	0.022	0.0032	0.026	No	No

High molecular weight PAHs identified as COPCs tend to be immobile in soil due to negligible solubility and high K_{oc} values. High molecular weight PAHs have not been identified as COPCs for the soil-to-groundwater migration pathway at the OBG adjacent to the RFI study area and these PAHs have not been detected in groundwater samples collected from the OBG in 2008 (Draper Aden 2009a in Appendix G). Based on the limited detection above site-specific SLs, the immobile nature of the high molecular weight PAHs in soil, and lack of groundwater detections at the OBG, PAHs are not considered a potential concern for the soil-to-groundwater pathway in the RFI study area.

5.1.4.7 Explosives - 2,4,6-TNT, 2,6-DNT, and Nitroglycerin

Explosives detected as COPCs in soil have moderate solubility in water. The K_{oc} values for the explosives range from medium low for nitroglycerin, to moderate for 2,6-DNT, and to moderately high for 2,4,6-TNT. Based on their solubility and K_{oc} values, explosives are expected to have some mobility in soil and potential to leach to groundwater if present at sufficiently high concentrations. As presented in the table below, 2,4,6-TNT and nitroglycerin had detected concentrations in one or more samples above their site-specific SLs (Appendix C.7) and the mean soil concentration of 2,3,6-TNT was below its site-specific SL.

COPC	Detected Concentrations (mg/kg)			MDC Above SL	Mean Above SL
	MDC	Mean	Site-Specific SL		
2,4,6-Trinitrotoluene	3	0.23	0.408	Yes (3)	No
2.6-Dinitrotoluene	0.39	N/A	1.5	No	No
Nitroglycerin	21	1.06	0.056	Yes (6)	Yes

Although low levels of explosives have been detected at concentrations above site-specific SLs, based on the limited number of samples above SLs, the mean concentrations being below the site-specific SL with the exception of nitroglycerin, and the lack of explosives detections in groundwater at the OBG (the source area for chemicals in the RFI study area), explosives are not considered a potential concern for the soil-to-groundwater pathway in the RFI study area.

5.2 FATE AND TRANSPORT SUMMARY

Volatilization was not identified as an important fate and transport process in the RFI study area given the identification of one volatile COPC (TCE) in soil for the soil to groundwater migration pathway only. Degradation processes are not expected to be a significant fate and transport process in soil given that lead is the primary COPC. Erosion processes and mass transport of surface soil are expected to be impeded by the presence of thick vegetative cover across the RFI study area. A quantitative evaluation of soil erosion in the RFI study area indicated that minimal

mass of lead would be potentially transported to the river by erosion processes and the potential soil loss is not considered a significant future risk to the New River. Leaching from soil is not expected to be a significant fate and transport process given that lead is strongly adsorbed to soil. The latest groundwater data (2008) from monitoring wells located adjacent to the perimeter berm separating the OBG from the RFI study area did not indicate leaching of detectable levels of lead or other site soil COPCs to groundwater.

Table 5-1a
Chemical Properties Affecting Fate and Transport
Study Area at SWMU 13 RFI Report
Radford Army Ammunition Plant, Radford, VIrginia

Property	Description
Specific Gravity	Specific gravity is the ratio of the density of a chemical to the density of water and its tendency to float (specific gravity <1) or sink (specific gravity >1) in water. Chemicals that are immiscible in water can exist as non-aqueous phase liquids and are referred to as light non-aqueous phase liquid if their specific gravity is less than one, or dense non-aqueous phase liquid if their specific gravity is greater than one.
Water Solubility	Water solubility of a chemical is the mass of chemical that will dissolve in a unit volume of water at a specific temperature. Chemicals with a high solubility tend to remain dissolved in water rather than partition to soil or sediment are less likely to volatilize, and more likely to biodegrade. Chemicals with a low solubility tend to partition to soil or sediment, are more likely to volatilize and less likely to biodegrade.
Vapor Pressure	Vapor pressure of a chemical is how readily it will volatilize to the atmosphere. Volatilization from water is dependent upon vapor pressure and Henry's law constant. Vapor pressures in their pure state range from 0.001 to 760 millimeters mercury (mm Hg) for liquids to less than 1E-10 mm Hg for solids.
Henry's Law Constant	Henry's law constant of a chemical is a measure of how a chemical will partition between air and water at equilibrium. It is the ratio of the vapor pressure to the water solubility (atm-m^3/mole) and can be used to calculate the rate of volatilization of a chemical from water. Chemicals with a high Henry's law constant more readily volatilize from water.
Organic Carbon Partition Coefficient (K_{oc})	K_{oc} is a measure of the tendency for a chemical to be sorbed to the organic fraction of soil and sediment. The lower the K_{oc} values the more leaching potential from soil or sediment to water. Chemicals with a K_{oc} less than 100 milliliters per gram (mL/g) have a high potential to leach from soil or sediment to water, while K_{oc} values in the range of 100 to 500 mL/g indicate a moderate leaching potential.
Octanol-Water Partition Coefficient (Ko_w)	K_{ow} describes the partitioning of an organic chemical between a polar phase (water) and a relatively nonpolar phase (1-octanol). It is equated to the partitioning (sorption) in an aquifer of a chemical between the water and the porous media organic content. A chemical with a high K_{ow} is hydrophobic and may be relatively immobile in an aqueous system but may be mobilized in the presence of an organic solvent.

Table 5-1b
Fate Processes Affecting Metals
Study Area at SWMU 13 RFI Report
Radford Army Ammunition Plant, Radford, Virginia

Process	Description
Ion Exchange	Ion exchange is a specific category of adsorption due to an affinity of the solid surface for the chemical. Ion exchange occurs when the adsorbent charge deficiency can be neutralized more efficiently by ions in solution than by those ions currently adsorbed. As an example, if sodium ions (monovalent) have accumulated at the interface and suddently calcium ions (divalent) appear, the surface excess can be more efficiently neutralized by the calcium ions than by the sodium ions; thus, the sodium ions will desorb and the calcium ions will adsorb and an exchange of ions will occur. Clay minerals are frequently the dominant source of ion exchange in the subsurface. The surface charge of clays and many other mineral surfaces is a function of pH. At low pH (excess hydrogen ions), the surface can exhibit a positive net charge while at higher pH (excess hydroxyl ions) the surface can exhibit a negative charge (Knox et al 1993). The surface area of the exchange site significantly influences the level of adsorption; this parameter is typically discussed in terms of the cation exchange capacity (CEC) of the medium and is expressed in units of milliequivalents of exchanging cations per 100 grams of solids (meq/100 g). CEC values indicate the likely type of clay present; the higher the CEC value the greater the absorption potential.
Chemical Speciation	Most metals occur in more than one ionic form (species) in solid and aqueous media. These species form from hydrolysis, oxidation reduction reactions, and complexation reactions, which may have different valences and mobilities in soil water, groundwater, and surface water due to different affinities for adsorption and different solubilty controls. Simple ionic specifies frequently combine ligands to form ionic or neutral-charge aqueous complexes. Environmental conditions that affect speciation of metals include pH, redox potential, and organic ligands.
Oxidation Reduction Potential (ORP)	Redox refers to the transfer of electrons and resultant specifies change of ions or compounds. Oxidation is the loss of electrons and reduction is the gain of electrons. Redox can cause changes in the mobility of many metals, such as site COPCs iron, manganese, and arsenic. The ability of a redox reaction to occur is a function of the redox potential. Redox potential is typically defined in terms of the negative logarithm of the free-electron activity (pE). The redox potential can also be expressed in terms of volts (Eh). Low values of pE indicate high electron activity and favor electron-rich species (reduced). High values of pE indicate low electron activity and favor electron-poor species (oxidized) (Knox et al 1993).

Table 5-1c
Fate Processes Affecting Organics
Study Area at SWMU 13 RFI Report
Radford Army Ammunition Plant, Radford, Virginia

Process	Description
Sorption	Sorption includes the processes of adsorption and absorption. Adsorption is a mass transfer process where a substance is transferred from a phase to the surface of a medium (e.g. soil or sediment) where it is bounded by chemical or physical forces. Absorption is the partitioning between two phases (Knox et al. 1993). Sorption reactions are either sorbent or solvent-motivated. Sorbent-motived reactions occur when there is an attraction between the sorbent and the solute and the chemical accumulates at the surface due to the affinity of the surface for the chemical. Solvent-motivated reactions occur when the chemical is hydrophobic, such as nonionic organics, where the chemical will accumulate at an interface or partition into a nonionic phase (associate with the organic content of the medium). For nonionic organics, the fraction of organic content (foc) of the subsurface material is the dominant soil characteristic affecting sorption (Knox et al. 1993). Primary indicators of the partitioning of a chemical are the organic carbon water partition coefficient (Koc), soil/water distribution coefficient (Kd), the octanol water partitioning coeffient (Kow), and the calculated retardation factor.
Hydrolosis	Hydrolysis is the degradation process via chemical reactions (oxidation, reduction, hydrolysis) without the participation of organisms. Hydrolysis is a chemical decomposition process that uses water to split chemical bonds of substances. There are two types of hydrolysis, acid and enzymatic. Hydrolysis is limited to chemical that contain hydrolyzable groups and is effected by the contaminants hydrolysis half life.
Volatilization	Volatilization is the process by which a contaminant changes from a liquid phase to a gas phase. This process applies to organic comtaminants migrating from the soil or surface water. Volatile organic chemicals are a class of chemicals that easily evaporate or mix with the atmosphere. The potential volatilization of a chemical is affected by the compounds vapor pressure, solubility, organic carbon partitioning coefficient, and the temperature.
Abiotic Degradation	Abiotic degradation includes degradation processes in which organisms do not participate. Photolysis describes the abiotic degradation process via photochemical reactions such as photooxidation, photomineralisation without the participation of organisms. As described above, hydrolysis is an additional process of abiotic degradation.
Biotic Degradation	Biotic degradations the process in which chemical degradation of a contaminant is aided by soil organisms. Biotic degradation can be either aerobic or anaerobic. The rate of metabolism/cometabolism is affected by the contaminant's biochemical oxygen demand, chemical oxygen demand, degree of halogenation, etc. Reactions include but are not limited to oxidation/reduction and hydrolysis, as described above.

Subject RTCs - SWMU 13 RFI Comments

Jim, here are EPA/VDEQ responses to Radford's responses to comments (RTCs) (Feb 10, 2010) for the SWMU 13 RFI. Any RTCs not noted below are acceptable.

1. EPA and VADEQ disagree that no hot spots for lead are present at SWMU 13. Two sample locations show lead concentrations that are substantially higher than lead levels reported in the remaining SWMU 13 samples. Acute risks associated with hot spot exposure should be evaluated, and to this end, EPA performed a risk analysis of these two areas. The Agency concludes that contact with conservatively drawn exposure areas of SWMU 13 is not expected to pose short term risks. However, in consideration of the substantially elevated lead result of 26,500 mg/kg for sample 13SB11B, institutional controls will be required to prevent future digging at this SWMU.

2. The data identified in this comment (1997 study) should be incorporated in the conceptual/mass balance model discussion of soil concentrations left in place and ramifications to river sediment concentrations, etc. How does this lead concentration compare to analyses from other nearby locations?

6. The response appears to be adequate and should be included in the report.

8 and 9. Figures 4-1 and 4-2 do not support the initial assumption that lead is the primary indicator for contamination at the study area. 12/15 samples exceeded residential screening levels with 2 above industrial. This is a much higher percentage of hits compared with the lead samples. In addition 8 of the 12 exceedances were at locations where lead was below screening levels.

10. Even though groundwater monitoring is being conducted as part of the OBG permit, SSLs are still appropriate for the evaluation of potential soil impact over the subject study area. The soil to groundwater pathway should still be evaluated as part of the overall assessment of the contaminated soils.

Please call or email me with any questions. Thanks

RTC USEPA Study Area at SWMU 13 RFI Comments.doc

Response to Comments (February 9, 2010)
Comments on the *Draft Study Area at Solid Waste Management Unit 13 RCRA Facility Investigation Report,* Radford Army Ammunition Plant (RFAAP), Virginia, dated July 2009 (RFI Report). Received November 3, 2009.

GENERAL COMMENTS

1. The RFI Report does not present a "hot spot" evaluation to determine whether there are localized areas of contamination that may require further evaluation or possible remediation. Section 1.5.1.1 of the *Final Work Plan Addendum 023 for RCRA Facility Investigation at Solid Waste Management Unit 13 (Work Plan Addendum 023)*, dated July 2008, states that additional soil sampling was required to further assess the nature and extent of lead in soil and to "identify any 'hot spot' areas with concentrations above the industrial [Action Level] AL." Section 4.2.3, Lead, of the RFI Report notes that lead was detected above its industrial Regional Screening Level (RSL) (800 milligrams per kilogram [mg/kg]) in six samples at the site, and above the residential RSL (400 mg/kg) in 21 samples at the site. The maximum concentration of lead in surface soil was reported as 8,620 mg/kg in sample 13SB8A and the maximum concentration of lead in subsurface soil was 26,500 mg/kg in sample 13SB11B, 4.5-5 feet. The RFI Report notes that "the majority of the 17 sample locations with lead concentrations above RSLs occur at discrete locations that are along or proximate to the perimeter berm of the [Open Burn Ground] OBG," however, it is unclear whether this area along the berm could be considered a "hot spot." Additionally, since limited soil data from the OBG were considered in this RFI (i.e., results of soil sampling required by the Subpart X Permit); it is unclear whether the lead contamination identified along the perimeter berm extends into the OBG. Revise the RFI Report to present a "hot spot" evaluation to determine any localized areas of contamination that may require further evaluation or remediation.

   Response: The study area itself is a strip of land approximately 40 feet wide located between the New River and an RCRA permitted unit (OBG). The study area cannot be developed since it is located in the 100-year flood plain and the slope of the terrain.

   The study area is not a typical disposal area. The study area itself was not an active area, but rather adjacent to an active area (OBG) and was potentially impacted by activities at the OBG. The original sampling plan was developed for the 1.6 acre area to provide sufficient data to identify any potential widespread elevated lead levels or "hot spots." The results of the investigation did not indicate widespread elevated lead levels or "hot spots." Since the study area was not an active site, "hot spot" areas would not occur within the study area from previous site activities. The maximum concentrations of lead detected in Samples 13SB8A and 13SB11B were collected during the SSP investigation and these concentrations were not replicated in any of the other SSP or RFI samples (181 samples) collected. These would be isolated elevated levels of lead within maximum approximate areas of 2,000 sq ft based on the grid sampling conducted.

   The lead concentrations detected along the berm were at discrete locations (Figures 4-1a and 4-1b) and do not indicate a "hot spot" due to no pattern or discernable distribution, but rather isolated elevated lead levels primarily above the residential screening level. Although these limited elevated lead levels were located proximate to the berm between

the study area and the OBG, per WPA 023 the soil within the OBG itself is regulated under the Subpart X permit and is therefore not assessed as part of this RFI.

Based on the results of the RFI, a "hot spot" evaluation for the site is not required due to the lack of identification of significant "hot spots" within the study area.

2. In the figures presented for the nature and extent of contamination evaluation in Section 4, sediment sample locations and results from previous investigations are not presented. However, showing the sediment sample locations (and in particular NRSE4, which reported a lead concentration of 4,415.58 mg/kg) in relation to the soil sample locations may help in understanding potential migration pathways for contaminants. Based on a cursory review of Figure 2-7, New River and Tributaries Study – 1997, which shows the location of sediment sample NRSE4, and Figure 4-1a, Extent of Lead in Soil, it appears that sample NRSE4 may have been located just downslope of some of the sample locations where soil exceedances were reported (e.g., 13SB8A, 13SB62A, etc.). Please revise the Section 4 figures to include the sediment sample locations in relation to the soil sample locations so that a complete evaluation of the nature and extent of contamination can be conducted.

   Response: During site visit conducted with the USEPA and VDEQ on the New River, the sediment sample locations were selected based on depositional areas within the river. Attributing chemicals detected in sediment samples to a specific source (such as the SWMU 13 study area) or sources is not possible for this RFI given the complex transient flow and depositional patterns in the river, and therefore, it is recommended that the sediment data be used holistically as part of any overall evaluations of the facility and potential receptors conducted for the RCRA Corrective Action Permit. Prior to the SSP/RFI, historical soil analytical data (1997) were considered screening level data and excluded from the risk assessment given the age of the data, the lack of available data validation reports/information, and the availability of sufficient newer validated sediment data to more appropriately characterize conditions.

3. The field sampling data sheets, included in Appendix C.3, indicate that refusal was encountered at many of the borings at shallow depths (<2 feet below grade). In several instances, refusal was encountered at 0.5 feet below grade or shallower (e.g., 13SB15, 13SB27, 13SB28, 13SB29, 13SB30, 13SB31, 13SB32, 13SB33, etc.) In these cases, only one surface soil sample was collected and submitted for laboratory analysis. In Work Plan Addendum 023, RAAP had proposed to collect up to two subsurface soil samples at each sample location. RAAP's Response to Comments on Work Plan Addendum 023, dated June 20, 2008, included at the beginning of Work Plan Addendum 023, stated in the response to Specific Comment 7 that "If refusal is encountered at a shallow or unexpected depth, soil digging bars, a slide hammer, or other similar device will be used to deepen the boring or verify refusal on bedrock. As appropriate, soil borings may be slightly offset to verify conditions or reach proposed target depths." The RFI Report does not indicate whether any of these methods were utilized in the field when shallow termination depths were encountered. Please revise the RFI Report to indicate whether any of the methods described in the Response to Comments were utilized in the field when shallow termination depths where encountered. Additionally, since surface soil samples were collected at many locations where subsurface soil

samples were proposed, describe implications of this deviation on achieving the investigation objectives. In particular, sample locations where RSL exceedances were reported in surface soil but deeper samples were not collected (e.g., 13SB63A) should be addressed.

Response: The RFI Report will be revised to provide information on actions taken when refusal was encountered at boring locations at depths substantially shallower than anticipated or planned. In general, a soil-digging bar was used to deepen the boring if possible or the boring was offset slightly in attempt to verify conditions or achieve a greater depth, if possible.

Shallow termination depths resulted in approximately 10 percent of the sample locations not having a subsurface sample where originally planned. The slight bias in the number of surface samples relative to subsurface samples is not considered to represent a significant constraint in achieving investigation objectives, given the likely historical release mechanisms from the adjacent OBG (surface release mechanisms rather than subsurface disposal) and low mobility of lead in soil that would tend to bias higher concentrations in surface soil.

4. According to the conceptual site model (CSM) (Figure 6-2), exposure routes associated with sediment and surface water were evaluated qualitatively. However, the qualitative assessment concerning these exposure media was not included in the HHRA. Revise the HHRA to include a detailed qualitative assessment concerning these exposure media as required by the MWP.

   Response: The following text will be added to Section 6.2.1: "Lead concentrations in New River sediment are below the human health residential SL of 400 mg/kg, with the exception of station NR-SED-16 (500 mg/kg) located downstream of the OBG, SWMU 54, and the RFAAP MMA. The mean concentration of lead for each sub-segment sampled and the entire reach sampled was below 400 mg/kg.

   The SWMU 54 RFI/CMS Report (URS 2008b) concluded that attributing lead and other metals detected in sediment samples to a specific source or sources is not possible for the RFI given the complex transient flow and depositional patterns in the river, and therefore, it is recommended that these data be used holistically as part of any overall evaluations of the facility and potential receptors conducted for the RCRA Corrective Action Permit.

   During the SWMU 54 RFI/CMS investigation, it was established that lead tends to partition to sediment rather than remain in surface water: therefore, the risk to human health receptors is considered minimal with regard to exposure to lead in surface water."

5. Section 6.4, Risk Characterization: This section refers to the default age-dependant adjustment factors that appear in USEPA 2005; however, a specific description of how risks were calculated for carcinogens that act via a mutagenic mode of action (MOA) should be included in the RFI (either in Section 6 or in Appendix E) to ensure that the RFI contains sufficient information to remain a stand-alone document. For the SWMU 13 Study Area, these compounds include benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenz(a,h)anthracene. It is noted that Appendix E.3 contains

a Region 3 memo providing example calculations of the derivation of Risk Based Concentrations for MOA contaminants; however, this is not an actual site specific risk calculation.

Response: Appendix E.3 will be updated to provide an example site specific risk calculation for benzo(a)pyrene for the child resident, adult resident, and lifetime resident for total soil.

6. Response to comments on the Work Plan Addendum (WPA) 023 indicate that five (5) dioxin samples have been collected at the SWMU 13 Study Area; one sample in 2008 and four samples between 2005 to 2007. Therefore, please clarify in Section 6.0 why only one dioxin sample was used in the risk assessment. Further, Section 6.1.1.1, Surface Soil and Total Soil, indicates that only soil data from 2003 and 2008 were used in the risk assessment; however, it appears that soil samples were also collected between 2005 and 2007 (e.g., dioxin). Please revise Section 6.0 to provide the complete decision rationale for only using one dioxin sample in the risk assessment and, in general, why only data from 2003 and 2008 were used in the risk assessment.

   Response: Per the referenced response to comment (dated 6/20/2008) from the work plan (General Comment), "In addition to the surface soil sample collected as part of the SSP and analyzed for dioxin/furans, soil samples were collected semi-annually (2007) from two locations (SB-1 and SB2) within the study area as shown on Figure 1-10 and analyzed for dioxin/furans as a component of the Subpart X permit for the OBG. As presented in Table 1-4, the detected concentrations of dioxin/furan TEQs for these samples were below both the industrial and residential RBCs. Given that the detected concentrations for dioxin/furans for a total of five samples were below applicable screening levels, no additional sampling for dioxin/furans is necessary."

   The one sample used in the screening is the sample collected during the SSP investigation. The additional four dioxin/furan samples were collected as part of the Subpart X permit for the open burning ground and are screened in Table 2-4 of the RFI. The concentrations were below the applicable screening levels; therefore, would not result in the inclusion of dioxin/furans as a COPC.

SPECIFIC COMMENTS

7. **Table 3-1, Field Sample Identifiers, Depths, and Analytical Methods:** For the SWMU 13 RFI Soil Borings, it appears that only one sample was collected at soil boring location 13SB14 from 0-0.5 feet below grade. The field sampling data sheet for this boring, included in Appendix C.3, does not indicate that refusal was encountered at 0.5 feet, so it is unclear why additional deeper samples were not collected. Please revise the RFI Report to address this concern.

   Response: The refusal depth was inadvertently left off the field data sheet for 13SB14. The field data sheet will be revised to indicate a refusal depth of 0.5 ft bgs.

8. **Section 4.2.8, SVOCs, Page 4-4:** This section identifies the semi-volatile organic compounds (SVOCs) that were detected above RSLs, but it does not address the extent of

this contamination. Figures 4-2a and 4-2b, Extent of Organic COPCs in Soil, appear to show that the western and southern extents of this contamination have not been defined. No samples west or south of sample 13SB7A, which reported a benzo(a)pyrene exceedance, were analyzed for SVOCs. Please revise Section 4.2.8 to describe the extent of SVOC contamination at the site, and indicate whether the extent of SVOC contamination has been evaluated sufficiently in consideration of the data gap mentioned above.

Response: As stated in the response to comments (dated 6/20/2008) for the work plan (Comment #5), the selected locations reflect the objectives of verifying previous results, providing additional spatial data across the site to characterize site conditions, and providing sufficient data to characterize mean concentrations for risk assessment, while recognizing that lead will be used as the primary indicator to evaluate impacts from historical open burning ground activities and delineate the nature and extent of contamination." The calculated risk associated with the site did not indicate the need for further assessment on the basis of human health. In addition, lead was used as the primary indicator to evaluate impacts from the open burning ground and was sufficiently characterized for the site.

9. **Figure 4-2b, Extent of Organic COPCs in Soil** It does not appear that the extent of nitroglycerin in soil has been evaluated sufficiently. Sample 13SB13C detected nitroglycerin above the industrial RSL, but no samples were analyzed for this constituent east of this location, or at a depth greater than 6 feet below grade. Please revise the RFI Report to address this data gap.

   Response: As stated in the response to comments (dated 6/20/2008) for the work plan (Comment #5), the selected locations reflect the objectives of verifying previous results, providing additional spatial data across the site to characterize site conditions, and providing sufficient data to characterize mean concentrations for risk assessment, while recognizing that lead will be used as the primary indicator to evaluate impacts from historical open burning ground activities and delineate the nature and extent of contamination." The calculated risk associated with the site did not indicate the need for further assessment on the basis of human health. In addition, lead was used as the primary indicator to evaluate impacts from the open burning ground and was sufficiently characterized for the site.

10. **Section 5.1.4, Leaching of Chemicals From Soil to Groundwater, Page 5-3 and Page 5-4:** The individual evaluations for several of the contaminants of potential concern state that many of the contaminants (antimony, lead, thallium, polynuclear aromatic hydrocarbons, nitroglycerin) have not been identified as COPCs for the soil-to-groundwater migration pathway at the OBG adjacent to the RFI study area. However, it does not appear that site-specific data from the current RFI for the study area adjacent to the OBG were evaluated with respect to soil-to-groundwater migration screening levels (SSLs). EPA's Regional Screening Level Table includes Protection of Groundwater SSLs that can be used to evaluate the potential for leaching of chemicals to groundwater. Please revise the RFI Report to screen detected concentrations in soil against the Protection of Groundwater Soil Screening Levels. If exceedances are identified, evaluation of groundwater within the RFI study area may be warranted.

Response: As stated in Section 1.5.1.3 of approved WPA 023, "Groundwater in the area of OBG is currently being evaluated under the facility's Subpart X permit issued by the Virginia Department of Environmental Quality (VDEQ) in October 2005. Groundwater monitoring and any required corrective action for groundwater will be addressed under the facility's Subpart X permit; therefore, groundwater will not be further investigated or addressed under this RFI." Soil samples were not assessed with respect to soil-to-groundwater migration screening levels since the constituents present within the study area would have originated from the open burning ground, the study area location immediately downgradient of the OBG, and the groundwater at the OBG is currently being addressed under the Subpart X permit.

Per previous discussions with the USEPA and VDEQ during the work plan development, it was agreed that the results of the Subpart X permit groundwater monitoring would be discussed within this RFI, but that soil with respect to risk to human ecological receptors would be the media of interest with regard to the RFI study area.

11. **Section 6.1.1, Data Summary, Page 6-2:** The third bullet on page 6-1 discusses how duplicate samples were incorporated into the risk assessment. According to Section 6.1.1, data from duplicate sample pairs are averaged and treated as one result, and if an analyte is detected in one of the sample pair, one-half the detection limit of the non-detect is averaged with the detected result. Since there is evidence that the compound is present in these cases, the actual method detection limit (MDL) should be used for averaging purposes, rather than one-half the MDL. Alternatively, the maximum duplicate concentration should be used in the risk analysis to be more protective. Please provide the rationale for not following either of these approaches.

    Response: This methodology has been utilized in past risk assessments. The non-detect result could be as low as zero or up to the MDL for the sample; therefore, it is considered appropriate and reasonably conservative to utilize ½ the MDL in averaging the result. Utilizing the MDL could consistently overestimate the risk. It is important to note that for statistical analysis the use of ½ the MDL for non-detects or in some cases a random number generator, which generates random numbers between 0 and the MDL, is recommended.

12. **Section 6.4.2, Background, Page 6-12:** A background analysis was conducted following the quantitative analysis of total risks. In general, statistical evaluations were conducted by comparing metals concentrations in soil at the study area of SWMU 13 to background concentrations presented in the RFAAP Facility-Wide Background Study Report prepared in 2001, with the exception of manganese. Although manganese in surface soil was demonstrated to be consistently lower than facility-wide background, a statistical evaluation of manganese in total soil was conducted using data from the RFI study area and the background area at SWMU 54. This evaluation concluded that the concentrations of manganese for total soil within the RFI study area were considered to be within background for alluvial soil and not indicative of effects from operational activities at the open burning ground (OBG) on the RFI study area. As presented, this conclusion is not well supported without additional information. The applicability of SWMU 54 background data is in question since the facility wide background data were relevant to

evaluate all metals in surface soil except for manganese. Further, based on the nature of activities conducted at SWMU 13 it is entirely possible that manganese found within the study area is site-related as the study area lies between the perimeter berm of the OBG and the north bank of the New River. While a berm is present to prevent runoff from the OBG into New River, combustion products could have migrated via air over the berm, deposited onto the soil, and subsequently entered New River via runoff; note these transport mechanisms were highlighted in Section 6.2.1 Conceptual Site Model/Receptor Characterization, page 6-4. Manganese is released into the environment from various sources including open burning (e.g.., fossil fuel combustion) (Agency for Toxic Substances & Disease Registry [ATSDR] 2009: http://www.atsdr.cdc.gov/toxprofiles/tp151.html, Toxicological Profile for Manganese). Please revise the HHRA to explain why the background data from SWMU 54 is more relevant to use when assessing manganese in total soil rather than basing conclusions on the facility-wide background data, which was applied to the rest of the metals in surface and total soil. Further, include a qualitative evaluation of manganese in Section 6.6 (Uncertainty Analysis) to explain the impacts of using SWMU 54 data over the facility-wide data for manganese in total soil.

Response: As presented in previous reports (SWMU 54, SWMU 45, SWMU 38, etc.), total manganese concentration in the alluvium tend to be higher than other soil on the plant. The manganese concentrations from SWMU 54 in the area located outside the fence, which was not impacted by previous activities at the site, were used in this comparison since this area is similar to the study area and located slightly downstream the study area. The elevated manganese concentrations are considered to be geologic in nature rather than site related.

13. **Section 6.6.4, Toxicological Data, Pages 6-16 and 6-17:** Section 6.6.4 indicates that provisional toxicity values were used for aluminum, antimony, arsenic, carbazole, cobalt, iron, thallium, vanadium and nitroglycerin. This section further states that some detected constituents (carbazole, dibenzofuran, and dimethylphthalate) do not have Regional RSLs and that provisional/surrogate toxicity values were not available for these COPCs with the exception of carbazole. For completeness, please revise the HHRA to discuss the appropriateness of using the provisional toxicity value for carbazole, provide the value and the source of the value (e.g., Human Health Affects Summary Table [HEAST]).

    Response: A discussion of the appropriateness of using a provisional value is discussed in the third to the last paragraph of Section 6.6.4. The second to the last sentence of the second to the last paragraph will be revised as follows: "Provisional/surrogate toxicity values were not available for these COCPs with the exception of carbazole for which a Human Health Affects Summary Table (HEAST) value from the 1997 table was used."

14. **Appendix E, Human Health Risk Assessment, Tables E.1-2.1 through E.1-2.3:** Please ensure these tables are revised to use the April 2009 RSLs or explain the impact of using an older version in the uncertainty analysis. Also, revise the footnotes of Tables E.1-2.1 and E.1-2.2 to clarify that the screening values for dioxins/furans are based on toxicity relative to 2,3,7,8-TCDD. While this process was described in Section 6.1.1, Data Summary, it would be helpful to provide a footnote in the aforementioned tables to clarify the screening process concerning dioxins/furans.

Response: The risk assessments were completed prior to the release of the April 2009 RSL table in May 2009. If an updated value (April 2009) changed significantly so that it would impact the conclusions for the site, an analysis of the effects of this change will be conducted. A discussion of the use of the September 2008 SLs versus the April 2009 SLs will be added to the uncertainties section of the report.

15. **Appendix E, Human Health Risk Assessment, Tables E.1-4.1a through E.1-4.1c:** It is unclear why an exposure factor (EF) of 50 days is being used for maintenance workers. Please note that the *Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites* dated December 2002 (SSL Guidance) indicates that an EF of 225 days should be used for outdoor workers in roles including, but not limited to, groundskeepers, gardeners, specified mechanics and repairers, non-specified mechanics and repairers, construction and maintenance workers, and painters. While it appears that maintenance workers at the SWMU 13 Study Area may not encounter the site this frequently, the RFI/CMS Report should include further rationale for reducing the EF of 225 days for maintenance workers to 50 days. At a minimum, an EF of 100 days is recommended as this value would be more protective and would be based on two days per week per year, with two weeks vacation. Please revise the HHRA to further support the professional judgment that 50 days would be more representative for a maintenance worker at this site by describing the anticipated type of maintenance work most likely to occur, or please revise the HHRA to use an EF of 100 days or 225 days for maintenance workers.

    Response: Note 1 on Table E.1-4.1a through E.1-4.1d will be revised as follows: "(1) Best professional judgment. Based on site maintenance conducted 1 day/week with 2 weeks/year vacation. This is considered a conservative exposure frequency based on the nature of maintenance activities likely conducted at the site which would include occasional mowing since the site not active."

16. **Section 7.1.1, Ecological Site Characterization, Page 7-2:** The text states that a Virginia Department of Game and Inland Fisheries survey identified two rare plant species (i.e., Midland Sedge and Shaggy False Gromwell) associated with grassland communities at RFAAP. Please specify if the plant communities at SWMU 13 have been evaluated for the presence of these two species.

    Response: The following text will be added to Section 7.1.1: "No threatened wildlife species or rare plant species were identified at the site."

17. **Section 7.3.1, Data Organization, Page 7-3:** This section did not describe how duplicate samples were handled. The descriptions in the "Location of maximum concentration" column in Table F.2-1 (SLERA Occurrences/Distributions – Surface Soil) suggest that duplicates were averaged together with the original sample. Please briefly describe in this section how duplicates were evaluated in the SLERA.

    Response: The following text will be added to Section 7.3.1: "Data from duplicate sample pairs are averaged and treated as one result. If an analyte is detected in one of the sample pair, one half the detection limit of the non-detect is averaged with the detected result and the result is considered detected."

18. **Section 7.6.2, Dose Rate Modeling Approach, Page 7-8:** The table in this section summarizes the chemicals which either had only NOAEL HQs above 1 or NOAEL and LOAEL HQs above 1 per receptor. One error was identified when the table was compared to Tables F.2-14 through F.2-23. The list of chemicals for the American Robin, which had a NOAEL above 1.0 did not include 2, 4, 6-Trinitroluene. Please revise this table accordingly.

    Response: Table will be revised to include 2,4,6-trinitrotoluene for the American Robin for an HQ above 1 for NOAEL only.

19. **Section 7.7, Risk Management – Scientific Management Decision Point (SMDP), Italicized Conclusion, Page 7-9:** The SMDP states that "Although metal concentrations in plants were above the screening levels, indications of chemical vegetative stress were not observed at the site." The lack of observable chemical vegetative stress is insufficient grounds for concluding no risk to the plant community. For example, it is not known if the local plant community shows a response in terms of lower species diversity, reduced growth, or other more subtle responses that might be observable when compared to an unimpacted reference location. Please discuss in the uncertainty section the limitations of the current conclusion on the lack of risk to the plant community. This additional information will help support risk management decision process.

    Response: The following text will be added to Section 7.8.3: "The qualitative nature of the conclusion of lack of risk to the plant community based on the lack of indicator of chemical vegetative stress and lush vegetation present at the site creates uncertainty since it is not known that if the local plant community shows a response in terms of lower species diversity, reduced growth, or other more subtle responses that might be observable when compared to an unimpacted reference location."

20. **Section 7.8, Exposure and risk uncertainty analysis, Page 7-9 and 7-10:** This section should be expanded to address issues associated with (a) the potential for additive toxic effects of exposure by wildlife receptors to site-related chemicals, (b) the qualitative nature of the evaluation of risk to the plant community, and (c) any concerns associated with listed plant species.

    Response: For part (a): The following text will be added to Section 7.8.6: "An HQ of less than one indicates that the contaminant alone is unlikely to cause adverse ecological effects. The potential for risk increases as the HQ increases above one. However, this result should be considered in the context of other characteristic of the exposure area. In addition, it should be noted that the calculation of chemical specific HQs does not account for multiple chemicals acting through the same exposure mechanism."

    For part (b): See Comment #19.

    For part (c): See Comment #16.

SWMU 13 RFI Comments.doc

Presented below are review comments on the *Draft Study Area at Solid Waste Management Unit 13 RCRA Facility Investigation Report*, Radford Army Ammunition Plant (RFAAP), Virginia, dated July 2009 (RFI Report).

GENERAL COMMENTS

1. The RFI Report does not present a "hot spot" evaluation to determine whether there are localized areas of contamination that may require further evaluation or possible remediation. Section 1.5.1.1 of the *Final Work Plan Addendum 023 for RCRA Facility Investigation at Solid Waste Management Unit 13 (Work Plan Addendum 023)*, dated July 2008, states that additional soil sampling was required to further assess the nature and extent of lead in soil and to "identify any 'hot spot' areas with concentrations above the industrial [Action Level] AL." Section 4.2.3, Lead, of the RFI Report notes that lead was detected above its industrial Regional Screening Level (RSL) (800 milligrams per kilogram [mg/kg]) in six samples at the site, and above the residential RSL (400 mg/kg) in 21 samples at the site. The maximum concentration of lead in surface soil was reported as 8,620 mg/kg in sample 13SB8A and the maximum concentration of lead in subsurface soil was 26,500 mg/kg in sample 13SB11B, 4.5-5 feet. The RFI Report notes that "the majority of the 17 sample locations with lead concentrations above RSLs occur at discrete locations that are along or proximate to the perimeter berm of the [Open Burn Ground] OBG," however, it is unclear whether this area along the berm could be considered a "hot spot." Additionally, since limited soil data from the OBG were considered in this RFI (i.e., results of soil sampling required by the Subpart X Permit); it is unclear whether the lead contamination identified along the perimeter berm extends into the OBG. Revise the RFI Report to present a "hot spot" evaluation to determine any localized areas of contamination that may require further evaluation or remediation.

2. In the figures presented for the nature and extent of contamination evaluation in Section 4, sediment sample locations and results from previous investigations are not presented. However, showing the sediment sample locations (and in particular NRSE4, which reported a lead concentration of 4,415.58 mg/kg) in relation to the soil sample locations may help in understanding potential migration pathways for contaminants. Based on a cursory review of Figure 2-7, New River and Tributaries Study – 1997, which shows the location of sediment sample NRSE4, and Figure 4-1a, Extent of Lead in Soil, it appears that sample NRSE4 may have been located just downslope of some of the sample locations where soil exceedances were reported (e.g., 13SB8A, 13SB62A, etc.). Please revise the Section 4 figures to include the sediment sample locations in relation to the soil sample locations so that a complete evaluation of the nature and extent of contamination can be conducted.

3. The field sampling data sheets, included in Appendix C.3, indicate that refusal was encountered at many of the borings at shallow depths (<2 feet below grade). In several instances, refusal was encountered at 0.5 feet below grade or shallower (e.g., 13SB15, 13SB27, 13SB28, 13SB29, 13SB30, 13SB31, 13SB32, 13SB33, etc.) In these cases, only one surface soil sample was collected and submitted for laboratory analysis. In Work Plan Addendum 023, RAAP had proposed to collect up to two subsurface soil samples at each sample location. RAAP's Response to Comments on Work Plan Addendum 023, dated June 20, 2008, included at the beginning of Work Plan Addendum

023, stated in the response to Specific Comment 7 that "If refusal is encountered at a shallow or unexpected depth, soil digging bars, a slide hammer, or other similar device will be used to deepen the boring or verify refusal on bedrock. As appropriate, soil borings may be slightly offset to verify conditions or reach proposed target depths." The RFI Report does not indicate whether any of these methods were utilized in the field when shallow termination depths were encountered. Please revise the RFI Report to indicate whether any of the methods described in the Response to Comments were utilized in the field when shallow termination depths where encountered. Additionally, since surface soil samples were collected at many locations where subsurface soil samples were proposed, describe implications of this deviation on achieving the investigation objectives. In particular, sample locations where RSL exceedances were reported in surface soil but deeper samples were not collected (e.g., 13SB63A) should be addressed.

4. According to the conceptual site model (CSM) (Figure 6-2), exposure routes associated with sediment and surface water were evaluated qualitatively. However, the qualitative assessment concerning these exposure media was not included in the HHRA. Revise the HHRA to include a detailed qualitative assessment concerning these exposure media as required by the MWP.

5. Section 6.4, Risk Characterization: This section refers to the default age-dependant adjustment factors that appear in USEPA 2005; however, a specific description of how risks were calculated for carcinogens that act via a mutagenic mode of action (MOA) should be included in the RFI (either in Section 6 or in Appendix E) to ensure that the RFI contains sufficient information to remain a stand-alone document. For the SWMU 13 Study Area, these compounds include benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenz(a,h)anthracene. It is noted that Appendix E.3 contains a Region 3 memo providing example calculations of the derivation of Risk Based Concentrations for MOA contaminants; however, this is not an actual site specific risk calculation.

6. Response to comments on the Work Plan Addendum (WPA) 023 indicate that five (5) dioxin samples have been collected at the SWMU 13 Study Area; one sample in 2008 and four samples between 2005 to 2007. Therefore, please clarify in Section 6.0 why only one dioxin sample was used in the risk assessment. Further, Section 6.1.1.1, Surface Soil and Total Soil, indicates that only soil data from 2003 and 2008 were used in the risk assessment; however, it appears that soil samples were also collected between 2005 and 2007 (e.g., dioxin). Please revise Section 6.0 to provide the complete decision rationale for only using one dioxin sample in the risk assessment and, in general, why only data from 2003 and 2008 were used in the risk assessment.

SPECIFIC COMMENTS

7. **Table 3-1, Field Sample Identifiers, Depths, and Analytical Methods:** For the SWMU 13 RFI Soil Borings, it appears that only one sample was collected at soil boring location 13SB14 from 0-0.5 feet below grade. The field sampling data sheet for this boring, included in Appendix C.3, does not indicate that refusal was encountered at 0.5 feet, so it

is unclear why additional deeper samples were not collected. Please revise the RFI Report to address this concern.

8. **Section 4.2.8, SVOCs, Page 4-4:** This section identifies the semi-volatile organic compounds (SVOCs) that were detected above RSLs, but it does not address the extent of this contamination. Figures 4-2a and 4-2b, Extent of Organic COPCs in Soil, appear to show that the western and southern extents of this contamination have not been defined. No samples west or south of sample 13SB7A, which reported a benzo(a)pyrene exceedance, were analyzed for SVOCs. Please revise Section 4.2.8 to describe the extent of SVOC contamination at the site, and indicate whether the extent of SVOC contamination has been evaluated sufficiently in consideration of the data gap mentioned above.

9. **Figure 4-2b, Extent of Organic COPCs in Soil** It does not appear that the extent of nitroglycerin in soil has been evaluated sufficiently. Sample 13SB13C detected nitroglycerin above the industrial RSL, but no samples were analyzed for this constituent east of this location, or at a depth greater than 6 feet below grade. Please revise the RFI Report to address this data gap.

10. **Section 5.1.4, Leaching of Chemicals From Soil to Groundwater, Page 5-3 and Page 5-4:** The individual evaluations for several of the contaminants of potential concern state that many of the contaminants (antimony, lead, thallium, polynuclear aromatic hydrocarbons, nitroglycerin) have not been identified as COPCs for the soil-to-groundwater migration pathway at the OBG adjacent to the RFI study area. However, it does not appear that site-specific data from the current RFI for the study area adjacent to the OBG were evaluated with respect to soil-to-groundwater migration screening levels (SSLs). EPA's Regional Screening Level Table includes Protection of Groundwater SSLs that can be used to evaluate the potential for leaching of chemicals to groundwater. Please revise the RFI Report to screen detected concentrations in soil against the Protection of Groundwater Soil Screening Levels. If exceedances are identified, evaluation of groundwater within the RFI study area may be warranted.

11. **Section 6.1.1, Data Summary, Page 6-2:** The third bullet on page 6-1 discusses how duplicate samples were incorporated into the risk assessment. According to Section 6.1.1, data from duplicate sample pairs are averaged and treated as one result, and if an analyte is detected in one of the sample pair, one-half the detection limit of the non-detect is averaged with the detected result. Since there is evidence that the compound is present in these cases, the actual method detection limit (MDL) should be used for averaging purposes, rather than one-half the MDL. Alternatively, the maximum duplicate concentration should be used in the risk analysis to be more protective. Please provide the rationale for not following either of these approaches.

12. **Section 6.4.2, Background, Page 6-12:** A background analysis was conducted following the quantitative analysis of total risks. In general, statistical evaluations were conducted by comparing metals concentrations in soil at the study area of SWMU 13 to background concentrations presented in the RFAAP Facility-Wide Background Study Report prepared in 2001, with the exception of manganese. Although manganese in surface soil was demonstrated to be consistently lower than facility-wide background, a statistical

evaluation of manganese in total soil was conducted using data from the RFI study area and the background area at SWMU 54. This evaluation concluded that the concentrations of manganese for total soil within the RFI study area were considered to be within background for alluvial soil and not indicative of effects from operational activities at the open burning ground (OBG) on the RFI study area. As presented, this conclusion is not well supported without additional information. The applicability of SWMU 54 background data is in question since the facility wide background data were relevant to evaluate all metals in surface soil except for manganese. Further, based on the nature of activities conducted at SWMU 13 it is entirely possible that manganese found within the study area is site-related as the study area lies between the perimeter berm of the OBG and the north bank of the New River. While a berm is present to prevent runoff from the OBG into New River, combustion products could have migrated via air over the berm, deposited onto the soil, and subsequently entered New River via runoff; note these transport mechanisms were highlighted in Section 6.2.1 Conceptual Site Model/Receptor Characterization**,** page 6-4. Manganese is released into the environment from various sources including open burning (e.g.., fossil fuel combustion) (Agency for Toxic Substances & Disease Registry [ATSDR] 2009: http://www.atsdr.cdc.gov/toxprofiles/tp151.html, Toxicological Profile for Manganese). Please revise the HHRA to explain why the background data from SWMU 54 is more relevant to use when assessing manganese in total soil rather than basing conclusions on the facility-wide background data, which was applied to the rest of the metals in surface and total soil. Further, include a qualitative evaluation of manganese in Section 6.6 (Uncertainty Analysis) to explain the impacts of using SWMU 54 data over the facility-wide data for manganese in total soil.

13. **Section 6.6.4, Toxicological Data, Pages 6-16 and 6-17:** Section 6.6.4 indicates that provisional toxicity values were used for aluminum, antimony, arsenic, carbazole, cobalt, iron, thallium, vanadium and nitroglycerin. This section further states that some detected constituents (carbazole, dibenzofuran, and dimethylphthalate) do not have Regional RSLs and that provisional/surrogate toxicity values were not available for these COPCs with the exception of carbazole. For completeness, please revise the HHRA to discuss the appropriateness of using the provisional toxicity value for carbazole, provide the value and the source of the value (e.g., Human Health Affects Summary Table [HEAST]).

14. **Appendix E, Human Health Risk Assessment, Tables E.1-2.1 through E.1-2.3:** Please ensure these tables are revised to use the April 2009 RSLs or explain the impact of using an older version in the uncertainty analysis. Also, revise the footnotes of Tables E.1-2.1 and E.1-2.2 to clarify that the screening values for dioxins/furans are based on toxicity relative to 2,3,7,8-TCDD. While this process was described in Section 6.1.1, Data Summary, it would be helpful to provide a footnote in the aforementioned tables to clarify the screening process concerning dioxins/furans.

15. **Appendix E, Human Health Risk Assessment, Tables E.1-4.1a through E.1-4.1c:** It is unclear why an exposure factor (EF) of 50 days is being used for maintenance workers. Please note that the *Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites* dated December 2002 (SSL Guidance) indicates that an EF of 225 days should be used for outdoor workers in roles including, but not limited to, groundskeepers, gardeners, specified mechanics and repairers, non-specified mechanics and repairers,

construction and maintenance workers, and painters. While it appears that maintenance workers at the SWMU 13 Study Area may not encounter the site this frequently, the RFI/CMS Report should include further rationale for reducing the EF of 225 days for maintenance workers to 50 days. At a minimum, an EF of 100 days is recommended as this value would be more protective and would be based on two days per week per year, with two weeks vacation. Please revise the HHRA to further support the professional judgment that 50 days would be more representative for a maintenance worker at this site by describing the anticipated type of maintenance work most likely to occur, or please revise the HHRA to use an EF of 100 days or 225 days for maintenance workers.

16. **Section 7.1.1, Ecological Site Characterization, Page 7-2:** The text states that a Virginia Department of Game and Inland Fisheries survey identified two rare plant species (i.e., Midland Sedge and Shaggy False Gromwell) associated with grassland communities at RFAAP. Please specify if the plant communities at SWMU 13 have been evaluated for the presence of these two species.

17. **Section 7.3.1, Data Organization, Page 7-3:** This section did not describe how duplicate samples were handled. The descriptions in the "Location of maximum concentration" column in Table F.2-1 (SLERA Occurrences/Distributions – Surface Soil) suggest that duplicates were averaged together with the original sample. Please briefly describe in this section how duplicates were evaluated in the SLERA.

18. **Section 7.6.2, Dose Rate Modeling Approach, Page 7-8:** The table in this section summarizes the chemicals which either had only NOAEL HQs above 1 or NOAEL and LOAEL HQs above 1 per receptor. One error was identified when the table was compared to Tables F.2-14 through F.2-23. The list of chemicals for the American Robin, which had a NOAEL above 1.0 did not include 2, 4, 6-Trinitroluene. Please revise this table accordingly.

19. **Section 7.7, Risk Management – Scientific Management Decision Point (SMDP), Italicized Conclusion, Page 7-9:** The SMDP states that "Although metal concentrations in plants were above the screening levels, indications of chemical vegetative stress were not observed at the site." The lack of observable chemical vegetative stress is insufficient grounds for concluding no risk to the plant community. For example, it is not known if the local plant community shows a response in terms of lower species diversity, reduced growth, or other more subtle responses that might be observable when compared to an unimpacted reference location. Please discuss in the uncertainty section the limitations of the current conclusion on the lack of risk to the plant community. This additional information will help support risk management decision process.

20. **Section 7.8, Exposure and risk uncertainty analysis, Page 7-9 and 7-10:** This section should be expanded to address issues associated with (a) the potential for additive toxic effects of exposure by wildlife receptors to site-related chemicals, (b) the qualitative nature of the evaluation of risk to the plant community, and (c) any concerns associated with listed plant species.

MEMORANDUM FOR Office of Environmental Quality, Radford Army Ammunition Plant (SJMRF-OP-EQ/Mr. Jim McKenna), P.O. Box 2, Radford, VA 24143-0002

SUBJECT: Draft RCRA Facility Investigation Report for SWMU 13, Radford Army Ammunition Plant, Virginia, July 2009

1. The US Army Center for Health Promotion and Preventive Medicine reviewed the subject document on behalf of the Office of The Surgeon General pursuant to Army Regulation 200-1 (Environmental Protection and Enhancement). We appreciate the opportunity to review this report.

2. We concur with the recommendation of no further action for this site as being protective of human health and the environment.

3. The document was reviewed by Mr. Dennis Druck, Environmental Health Risk Assessment Program. He can be reached at DSN 584-2953, commercial (410) 436-2953 or electronic mail, dennis.druck@us.army.mil.

FOR THE COMMANDER:

JEFFREY S. KIRKPATRICK
Director, Health Risk Management

EXECUTIVE SUMMARY

URS Group, Inc. (URS) conducted a Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) at the Radford Army Ammunition Plant (RFAAP) for Solid Waste Management Unit (SWMU) 13. SWMU 13 is an approximate 1.6 acre area located outside the current operational area of the RCRA Subpart X permitted open burning ground (OBG) between the OBG perimeter berm and the New River. The RFI was performed in accordance with the U.S. Environmental Protection Agency (USEPA) Region III and Virginia Department of Environmental Quality (VDEQ)-approved Master Work Plan (MWP) Addendum 023 (URS 2008a) and the requirements set forth in the 2000 RCRA permit for RFAAP (USEPA 2000).

The RFI was designed fill data gaps identified during the site screening process (SSP) investigation conducted in the RFI study area in 2003 (URS 2007a) and further evaluate potential releases to soil from historical activities at the adjacent OBG. The RFI assessed the nature and extent of lead in soil, which was identified in the SSP and previous investigations as the primary indicator chemical for evaluating releases to soil. A release and nature and extent assessment was conducted for other chemicals of potential concern (COPCs) identified during the SSP including explosives, nitroglycerin, semi-volatile organic compounds, and metals. Other objectives of the RFI were to assess the fate of detected chemicals, evaluate potential risks to human health and the environment, provide data to support the completion of a Corrective Measures Study (CMS), if required, and if possible, reach a final decision regarding what potential future action is warranted at the RFI study area.

Soil sampling with the RFI study area indicated that lead was the primary COPC based on limited detections of lead above the USEPA residential risk-bases screening level of 400 milligrams per kilogram ([mg/kg] 21 of 183 samples) and the USEPA industrial risk-based screening level of 800 mg/kg (6 of 183 samples). Most of the detections of lead above risk-based screening levels were in samples collected adjacent or proximate to OBG perimeter berm at isolated locations. Approximately 40 percent of these detections were closest to OBG Burning Pad 6. Other COPCs that were identified in soil included antimony, iron, thallium, four high molecular weight polynuclear aromatic hydrocarbons, and nitroglycerin. Groundwater monitoring conducted within the OBG adjacent to the perimeter berm has not indicated leaching of lead or other site COPCs from soil to groundwater at detectable levels. As presented in Section 4.4, based on the limited extent of chemicals in soil within the study area above RSLs, the low lying, lush vegetation present at the site (see photo log in Appendix A), and the percentage of ground cover (90%), the potential for RFI study area related releases from soil to the New River via runoff at levels of concern is not considered significant.

A human health risk assessment (HHRA) was performed to evaluate the potential human health effects associated with releases to soil in the RFI study area. Receptors evaluated included: current/future maintenance worker, current/future adolescent trespasser, hypothetical future construction worker, hypothetical future commercial worker, hypothetical future adult resident, hypothetical future child resident, and hypothetical future lifetime resident. Total carcinogenic risk calculated for each receptor was below or within USEPA's target risk range for Superfund sites (1E-06 to 1E-04, USEPA 1989). The results of the lead modeling predicted the probability of the receptors expected to have blood levels of 10 µg/dL or greater were below the established threshold of 5%. Total non-carcinogenic hazards after target organ segregation and consideration of background for all receptors were equal to or below the USEPA reference HI of 1E+00. The results of the human health risk assessment did not indicate a requirement for further action for soil in the RFI study area.

A screening level ecological risk assessment (SLERA) was performed to evaluate potential ecological risk associated with soil in the RFI study area. Receptors evaluated included soil invertebrates and microbes, plants, and terrestrial wildlife. The results of the screening level ecological risk assessment indicated there is adequate information to conclude that ecological risks were not significant at the RFI study area, and therefore, there was no need for further action for soil at the RFI study area on the basis of ecological risk.

Based on the results of the RFI, HHRA, and SLERA, no further action beyond the implementation of institutional controls to prevent future digging at the RFI study area is recommended. Institutional

controls (ICs) are being implemented at the RFI study area at SWMU 13 within the boundaries depicted on Figure 1-2. The objective of the ICs is to prevent future digging at the site. Specifically this site has been incorporated into plant management manual to ensure long-term protection of human health and the environment. The management manual provides for advance notice, assessment and approval of intrusive work that may occur within the plant with a general digging prohibition at sites such as this. In the event the property is transferred or leased, equivalent ICs will be put into terms and conditions of the deed or lease, which are no less restrictive than the IC objectives described above. Furthermore, the transferee or lessee will be responsible for ensuring IC compliance by any future users. However, the Army acknowledges the responsibility for all original liability under CERCLA and its right and responsibility to enforce ICs.

1.0 INTRODUCTION

This Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) report presents the results and findings of the investigations conducted at Solid Waste Management Unit (SWMU) 13, located in the Main Manufacturing Area (MMA) at the Radford Army Ammunition Plant (RFAAP), Radford, Virginia (Figure 1-1). The RFI study area at SWMU 13 is an approximate 1.6 acre area located outside the current operational area of the open burning ground (OBG) between the OBG perimeter berm and the New River (Figure 1-2). Previous investigations have been conducted at the OBG, which has been in operation since 1941 and was first identified as an area of concern in the RCRA Facility Assessment (RFA: USEPA 1987), but since 2005 the OBG has been regulated under a RCRA Subpart X permit issued by the Virginia Department of Environmental Quality (VDEQ). The RFI study area is the area adjacent to the OBG not addressed under the RCRA Subpart X Permit. The SMWU 13 RFI Work Plan is presented as Work Plan Addendum (WPA) 023, and incorporates, by reference, the elements of the RFAAP Master Work Plan (MWP) (URS 2003).

The work was conducted by URS Group, Inc. (URS) to fulfill the requirements set forth in the 2000 RCRA Corrective Action permit as tasked by the United States Army Corps of Engineers (USACE), Baltimore District. URS performed the RFI in accordance with the Master Work Plan (MWP) developed for RFAAP, Work WPA 023 (URS 2008a) to the MWP (URS 2003). These documents, approved by the United States Environmental Protection Agency (USEPA) Region III and the VDEQ, contain the Master Quality Assurance Plan (MQAP), the Master Health and Safety Plan (MHSP), and associated project-specific addenda.

The objective of this RFI is to evaluate potential releases in the RFI study area from historical operations at the adjacent OBG, assess the nature and extent of chemicals in soil located in the RFI study area, and evaluate potential risks to human health and the environment including potential future releases to the New River (Figure 1-2). Investigations will focus on soil conditions in this area and evaluate soil within the RFI study area as a potential source for future releases to the New River. Groundwater in the area of the OBG is currently being evaluated under the facility's Subpart X permit issued by the VDEQ in October 2005. Groundwater monitoring and any required corrective action for groundwater will be addressed under the facility's Subpart X permit; therefore, groundwater will not be further investigated or addressed under this RFI. Soil sampling and any required corrective action within the OBG also will be addressed under the facility's Subpart X permit; therefore, the soil located within the OBG will not be further investigated or addressed under this RFI. The RFI study area is the area adjacent to the OBG not addressed under the RCRA Subpart X Permit.

The additional investigation for this RFI will be to fill data gaps identified during the site screening process (SSP) investigation conducted in 2003 (URS 2007a) as follows:

- Further assessing chemical sources and the nature and extent of chemicals in soil within the RFI study area due to potential effects from the activities at the waste unit (OBG) located adjacent to the RFI study area;
- Assessing the fate of detected chemicals;
- Evaluating potential risks to human health and the environment;
- Provide data to support the completion of a Corrective Measures Study (CMS), if required; and
- If possible, reaching a final decision regarding what potential future action is warranted at the RFI study area.

Section 2.0 of this report presents site background information including: site history, physical setting, and previous investigation results. The RFI field investigation program is described in Section 3.0. Sufficient data was collected for the RFI to complete a Nature and Extent of Chemicals Assessment

(Section 4.0), Fate and Transport Evaluation (Section 5.0), Human Health Risk Assessment (HHRA) (Section 6.0), a Screening Level Ecological Risk Assessment (SLERA) (Section 7.0), and Conclusions and Recommendations (Section 8.0). The results of the risk assessments and fate and transport assessment did not indicate a requirement to complete a CMS for soil at the RFI study area and therefore, a CMS has not been prepared for this report.

2.0 SITE BACKGROUND

2.1 SITE DESCRIPTION

2.1.1 Physiography

The RFI study area is located in the western section of the Horseshoe Area (HSA) between the perimeter berm of the OBG and the north bank of the New River. This area is approximately 1,700 feet (ft) long and 40 to 60 ft wide or approximately 1.6 acres; it slopes moderately to steeply from an elevation of approximately 1,690 ft above mean sea level (msl) to 1,680 ft msl (Figure 1-2). The RFI study area is vegetated with tall grass and stands of trees, and it is located in the 100-year flood plain of the New River. The study area is located topographically downhill from the OBG and likely received drainage from the OBG prior to the reconfiguration of the OBG to prevent runoff of stormwater outside the unit (see Section 2.1.3). A site photographic log is included in Appendix A.

2.1.2 Tanks/Structures

The RFI study area is undeveloped. A berm and the installation perimeter fence are located between the RFI study area and the OBG to the north. The OBG is equipped with eight pairs of burning pads. Each burning pad contains a metal burning pan, approximately 18 ft long by 6 ft wide by 1 ft deep, and a mobile temporary storage unit (wheeled covers to prevent rainwater accumulation in the pans). Waste material is burned in the pans. An office trailer is located east of the OBG.

2.1.3 Surface Water

The RFI study area is located adjacent to the New River. The OBG has several features to control and prevent runoff of storm water outside of the unit including a perimeter berm, drainage ditches, and a storm water retention basin (Figure 2-1). Other manholes, catch basins, storm drains, or drainageways are not located in the site area. Any storm water runoff from the RFI study area is expected to flow south toward the New River. The heavy vegetative cover within the RFI study area will allow for infiltration of precipitation.

2.1.4 Soil and Geology

The RFI study area is underlain by Wheeling sandy loam soil, which is found on alluvial terraces along the New River. This soil has moderate permeability and medium to strong acidity. Available water capacity of the soil is moderate and surface runoff is slow. This soil does not have a seasonally high water table within 60 inches of the surface (URS 2003).

Five direct push soil borings and eighty hand auger borings were completed within the RFI study area to a maximum depth of 13 ft below ground surface (bgs) to characterize soil and geologic conditions. Alluvial soil encountered in the borings consisted primarily of fine to medium, silty sand (SM), with an approximate one foot layer of clayey gravel encountered in two of the direct push borings immediately above the refusal depth. Nine representative soil samples from the soil borings were submitted to URS' testing laboratory in Totowa, New Jersey, for physical testing and soil classification. Five of these samples also were tested for total organic carbon by Trimatrix Laboratories, Inc. (Trimatrix). Physical test results are summarized in Table 2-1 and complete test results and reports are included in Appendix

C.1. Soil samples were classified as silty sand (SM), with the exception of the clayey gravel (GC) sample collected from the termination depth of 13SB7. Soil samples were slightly below neutral pH (5.9 to 6.9 for measurement with distilled water) with total organic carbon in the range of 0.47 to 1.1 percent (%). One soil collected from a depth of 2 to 3 ft bgs was tested for vertical hydraulic conductivity, with a value of 1.3E-05 centimeters per second (cm/sec) reported by the laboratory.

Carbonate bedrock of the Elbrook Formation underlies alluvium in the RFI study area. The depth to bedrock at monitoring wells 13MW3, 13MW4, 13MW5, and 13MW6 installed within the OBG inside the perimeter berm (adjacent to the RFI study area) ranges from approximately 13 to 17 ft bgs. The slope of the bedrock surface in the OBG area is south toward the New River at an approximate gradient of approximately 1.3% (Dames & Moore 1992). Depth to bedrock in the RFI study area is expected to be progressively shallower toward the New River due to the steeply sloping ground surface from the OBG perimeter berm toward the river.

2.1.5 Groundwater

A detailed discussion of regional and RFAAP hydrogeology is presented in Section 3.8 of the MWP (URS 2003). Within the OBG, an unconfined aquifer occurs within the lower portion of unconsolidated alluvial terrace deposits underlying the site; groundwater is also present within the underlying bedrock. Depth to groundwater ranges from approximately 12 to 20 ft bgs within the operational area of the OBG and becomes progressively shallower toward the New River due to the sloping ground surface. Groundwater was encountered at the completion depths of SSP borings 13SB7 (12 ft bgs) and 13SB8 (3.7 ft bgs).

Groundwater data presented in the 2008 Annual Groundwater Monitoring Report for the OBG (Draper Aden 2009a) indicates that groundwater flow direction in this area is generally southward toward the New River. An estimated groundwater flow velocity of 1.03 feet per year (ft/year) was calculated across the OBG area for 2008 based on average calculated hydraulic conductivity values of 6.56E-06 feet per second (ft/second), an average hydraulic gradient of 0.002 ft/ft, and an effective porosity of 0.40 for carbonate rock and clayey, silty sand, and gravel alluvium.

2.1.6 Site Background – History

Open burning of waste and off-specification energetic products has been performed continuously at the OBG since manufacturing operations began at RFAAP in 1941. Open detonation has not been conducted. A RCRA Subpart X Permit was issued by the VDEQ in October 2005 for open burning at OBG. This unit operated under interim status prior to issuance of the permit.

Material burned at OBG has consisted of waste explosives propellants, and laboratory waste. Three types of propellant wastes have been burned including single base (nitrocellulose), double base (nitrocellulose and nitroglycerin), and triple base (nitrocellulose, nitroglycerin, and nitroguandine), as described in the RFA conducted in 1987 (USEPA 1987). Burning of other energetic materials or burning-rate modifiers, such as lead, dinitrotoluene (DNT), or other organic and inorganic chemicals was not mentioned in the RFA.

Use of the current eight pairs of burning pads and their appurtenances started in 1985 (Dames & Moore 1992). Previously, wastes were burned in earthen pits (i.e., burn pits) at the same locations currently occupied by the burning pads. Burn residue is visually inspected for untreated energetic material. All untreated energetic material is returned to the pans for treatment. Treated burn residue is transferred to an accumulation area for off-site disposal. Composite samples of the burn residue are periodically analyzed for disposal characterization.

The current Subpart X Permit requires the performance of operational and maintenance procedures and actions within the OBG operational area to mitigate releases to the environment (soil) from burning activities. Periodic soil sampling is required under the permit to verify that releases to soil have not occurred above established risk-based levels.

The RFI study area is an approximate 1.6 acre area located outside the current operational area of the OBG between the OBG perimeter berm and the New River (Figure 1-2). The OBG currently operates under a RCRA Subpart X Permit issued by the VDEQ in October 2005. The RFI study area is the area adjacent to the OBG not addressed under the RCRA Subpart X Permit.

2.2 PREVIOUS INVESTIGATIONS

Previous investigations were conducted primarily at the OBG itself, but previous investigations as they relate to the RFI study area (and adjacent New River) are discussed in the following sections. Note that the data provided in the following sections is screened against USEPA Region III October 2007 risk-based concentrations (RBCs) as presented in WPA 023.

2.2.1 Installation Assessment (Aerial Photograph Interpretation) – 1992

The Environmental Photographic Interpretation Center (EPIC), under the direction of the USEPA, performed an assessment of multiple SWMUs at RFAAP using selected aerial photographs from 1937 to 1986 (USEPA 1992). The photogeologic analysis was performed to locate waste management areas, identify the location of sinkholes that existed prior to the construction of the RFAAP, and map fracture traces.

1949 Aerial Photograph (Figure 2-2)

EPIC first noted activity at the burning ground on a 1949 photograph (USEPA 1992). The western portion of the burning ground had been cleared and appeared to be active, with seven burning pits visible. Apparent earth berms were located between each burn pit. A three sided berm was visible between the western portion and the eastern portion of the burning ground; this area may have been used for staging materials or burning. The eastern portion of the burning ground was mostly vegetated with outlines of potential inactive burn areas visible. A single access road was visible along the northern edge of the burning ground area. The RFI study area between the burning ground and the New River was vegetated and undeveloped.

1962 Aerial Photograph (Figure 2-3)

The entire burning ground appears to be active in this photograph. Dark-toned areas were noted within several of the burn pit areas. The three-sided berm shown in the 1949 photograph was still apparent in the same configuration. EPIC noted probable light-tone liquid was present in the burning pit area west of the three-sided berm (USEPA 1992). The access road has been modified to include a loop through the burning ground in the same configuration used currently. The center portion of the RFI study area appeared to have less vegetation than in the 1949 photograph, with more complete vegetative cover still present in other areas.

1971 Aerial Photograph (Figure 2-4)

Eight burning areas were apparent in the photograph with earth berms separating each area. One side of the three-sided center berm observed in the 1962 photograph was still intact. A “light-toned” liquid/material was observed near the remaining berm and “probable liquid” was present along the southern boundary (USEPA 1992). EPIC indicated that the probable liquid was potentially from flooding/precipitation.

1981 Photograph (Figure 2-5)

An interpretation of this photograph was not presented in the EPIC Report. Pit burning was still apparent on this photograph. An earth berm was apparent between the burning ground and the RFI study area. The RFI study area between the burning ground and the New River remained undeveloped and was completely vegetated.

1986 Photograph (Figure 2-6)

The method of burning at the burning ground had been changed from "pit burning" to "pan burning" between the 1981 and 1986 photographs. Western and eastern burning areas were apparent, with a center earth berm separating each area. Each burning area had four burning pads with two pans. Buggy paths were visible for each pan. A perimeter earth berm was apparent along the eastern, southern, and west sides of the burning ground. Two areas of "light-toned" material were visible near the northern edge of the burning ground, and several areas of "staining" were visible along the northwestern and southern boundaries. A lagoon was apparent at the eastern edge of the burning ground (USEPA 1992). The RFI study area between the burning ground and the New River was undeveloped and vegetated.

2.2.2 New River and Tributaries Study – 1997

The objective of the New River and Tributaries Study was to provide data to evaluate migration pathways along the New River and its tributaries at RFAAP to assess potential adverse effects to human health and the environment (Parsons 1997). Two surface water/sediment stations were sampled in the New River near the RFI study area including NRSE4/NRSW4 located adjacent to the site area and NRSE14/NRSW14 located downstream of the site area (Figure 2-7). Surface water and sediment samples were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), pesticides, polychlorinated biphenyls (PCBs), explosives, and target analyte list (TAL) metals. Detected analytical results for sediment and surface water are summarized in Tables 2-2 and 2-3, respectively.

Metals and SVOCs were detected in sediment sample NRSE4 collected adjacent to the RFI study area. Lead was detected in this sample at a concentration (4,415.58 milligrams per kilogram (mg/kg)) above the USEPA Industrial screening level (SL) of 800 mg/kg, USEPA Region III Biological Technical Assistance Group (BTAG) freshwater sediment screening level (35.8 mg/kg), and facility background point estimates (26.8 mg/kg) for soil. Chromium was detected at a concentration (37.53 mg/kg) above its USEPA Region III adjusted residential risk-based concentrations (R-RBC), but below its BTAG freshwater sediment screening level and facility background point estimate for soil. SVOC compounds were detected in sample NRSE4 at concentrations below their adjusted RBCs, but several phthalate compounds were detected at concentrations above their USEPA Region III BTAG freshwater sediment screening values (Table 2-2).

Metals were detected in sediment sample NRSE14 collected downstream of the RFI study area. The lead concentration in this sample (104 mg/kg) was below the USEPA residential SL of 400 mg/kg. Levels of aluminum, iron, manganese, thallium, and vanadium detected in sample NRSE14 were above their R-RBCs but below facility background point estimates for soil (Table 2-2). Arsenic was detected at a concentration above its USEPA Region III adjusted industrial risk-based concentrations (I-RBC), but below its BTAG freshwater sediment screening level and facility background point estimate for soil. Iron, lead, manganese, and zinc were detected at concentrations above their USEPA Region III BTAG freshwater sediment screening levels, but below facility background point estimates for soil with the exception of lead and zinc.

Barium and lead were detected in surface water sample NRSW4 collected adjacent to the RFI study area at concentrations above their BTAG surface water screening levels but below their USEPA Region III human health risk-screening criteria (Table 2-3). Other target analytes were not detected in this sample. Target analytes were not detected in the downstream surface water sample NRSW14.

2.2.3 OBG Soil and Groundwater Monitoring for RCRA Subpart X Permit 2005-2008

Groundwater in the area of OBG is currently being evaluated under the facility's Subpart X permit issued by the VDEQ in October 2005. Groundwater monitoring and any required corrective action for groundwater will be addressed under the facility's Subpart X permit; therefore, groundwater will not be further investigated or addressed under this RFI.

A component of the permit for the OBG is a *Soil Monitoring Program for the Open Burning Ground* (EEE Consulting Inc. 2005), which is intended to monitor the unit for potential impact to surface soil resulting from open burning ground operations. Currently, soil sampling events are conducted semi-annually. In addition to sampling soil within the operational area, the soil monitoring program (SMP) requires collection of surface soil samples (0 to 0.5 ft bgs) from two locations (SB-1 and SB-2) within the RFI study area outside and south of the perimeter berm of the OBG (Figure 2-8). The permit requires comparison of soil sample results to industrial-based action levels (ALs) included in the permit to evaluate whether further actions are required at the site.

As presented in the *2007-2008 Annual Soil Monitoring Report: Open Burning Ground* (Draper Aden 2009b, Appendix G), soil samples collected from locations SB-1 and SB-2 are analyzed for VOCs by SW-846 Method 8260C, SVOCs by SW-846 Method 8270C, RCRA metals by SW-846 Methods 6010B/7471A, dioxin/furans by SW-846 Method 8290, explosives by SW-846 Method 8330, and nitroglycerin by SW-846 Method 8332 (Draper Aden 2009b). Available sample results for locations SB-1 and SB-2 for the 2007 and 2008 soil sampling events are summarized in Table 2-4 for detected compounds. Constituents were not detected in these samples above the ALs specified in the permit and organic constituents were not detected above there adjusted R-RBCs.

One VOC, bromomethane, was detected in 1 of 8 samples at a concentration below its adjusted R-RBC. Explosive compounds 2,4,6-trinitrotoluene (2,4,6-TNT), 2-amino-4,6-dinitrotoluene, and 4-amino-2,6-dinitrotoluene were detected in 1 of 8 samples collected at concentrations below their adjusted R-RBCs. Arsenic was detected in one or more samples at concentrations above its adjusted I-RBC, but below its facility background point estimate. Chromium was detected in one or more samples at concentrations above its adjusted R-RBC, but below facility background point estimate. Barium, cadmium, and selenium were detected in one or more samples at concentrations below their adjusted R-RBCs. Lead was detected in the samples at concentrations below the residential SL of 400 mg/kg. Dioxin/furans were detected in samples SB-1 and SB-2 at concentrations below the adjusted R-RBC for 2,3,7,8-tetrachlorodibenzodioxin (2,3,7,8-TCDD) expressed as toxicity equivalent quotient, when using the current toxicity equivalency factors (WHO 2005).

RFAAP began semiannual detection groundwater monitoring at the OBG after the Permit went into effect in October 2005. During Fourth Quarter 2005, carbon tetrachloride and perchlorate were detected at concentrations above their respective background concentrations, which required development of a Compliance Monitoring Program. As a result, during First Quarter 2006, all wells were sampled for the constituents listed in Appendix IX of 40 CFR Part 264 to determine the Compliance Monitoring List. The hazardous constituents detected during the initial Appendix IX analysis formed the basis for the Compliance Groundwater Monitoring List for the Unit.

As presented in *Calendar Year 2008 Annual Groundwater Monitoring Report: Open Burning Ground* (Draper Aden 2009a, Appendix G), groundwater monitoring activities for calendar year 2008 were conducted in accordance with the proposed *Groundwater Compliance Monitoring Plan* dated February 2007, including the annual monitoring of the point of compliance (POC) wells for the constituents listed in Appendix IX of 40 CFR Part 264. The groundwater analytical data for the calendar year 2008 semiannual monitoring events were evaluated in accordance with the procedures specified in the proposed *Groundwater Compliance Monitoring Plan*, including comparison to the proposed Groundwater Protection Standards. As the proposed *Groundwater Compliance Monitoring Plan* is pending final review for incorporation into the Permit, the groundwater analytical data for calendar year 2008 were also compared to the background concentrations for the OBG previously calculated in the *Constituent Background Values for the Compliance Groundwater Monitoring Program Constituents* dated December 20, 2006.

During the calendar year 2008 semiannual groundwater monitoring events, perchlorate was detected in POC well 13MW4 at concentrations greater than the proposed groundwater protection standard of 26 µg/L. Additionally, carbon tetrachloride was detected in POC well 13MW3 at a concentration greater than the proposed groundwater protection standard of 5 µg/L during Fourth Quarter 2008. As a result,

RFAAP is required to establish a Corrective Action Program for carbon tetrachloride and perchlorate that meets the requirements of 40 CFR Part 264.100. RFAAP has submitted a proposed Corrective Action Program for carbon tetrachloride and perchlorate, which is pending final review for incorporation into the Permit.

As presented in *Calendar Year 2008 Annual Groundwater Monitoring Report: Open Burning Ground* (Draper Aden 2009a), RFAAP will continue to monitoring groundwater at the OBG in accordance with the *Groundwater Compliance Monitoring Plan* until the Corrective Action Program is approved and implemented, at which time groundwater monitoring will be conducted in accordance with the Corrective Action and Groundwater Monitoring Program.

2.2.4 Site Screening Process Investigation Report – 2007

The SSP was designed using specific human health and ecological screening processes to assess: 1) whether releases of hazardous substances, pollutants, hazardous wastes, or hazardous constituents have occurred to the environment at the sites evaluated, and 2) whether further investigation or action (i.e., risk assessment, RFI, interim action), or no further action (NFA) is appropriate at a site.

The SSP investigation was conducted in September-October 2003 and included completion of one soil boring inside the OBG operational area (13SB12) and completion of five soil borings (13SB7 through 13SB11) within the RFI study area outside of the OBG operational area (between the perimeter berm of the OBG and the New River) to evaluate for the presence or absence of chemicals in soil (URS 2007a).

Figure 2-9 shows the five soil boring locations within the RFI study area. Three soil samples were collected from each of these borings (surface sample, intermediate depth, and terminal depth), except at 13SB8 where two samples were collected due to apparent groundwater encountered at a depth of 3.7 ft bgs. Soil samples were analyzed for target compound list (TCL) VOCs, TCL SVOCs, polynuclear aromatic hydrocarbons (PAHs), explosives (including nitroglycerin and pentaerythritol tetranitrate [PETN]), and TAL inorganics. One surface soil sample also was analyzed for TCL pesticides, TCL PCBs, herbicides, and TCL dioxin/furans.

Two pairs of surface water and sediment samples were collected from the New River adjacent to the site (Figure 2-9). Sample pair 13SW2/13SE2 was collected at the western end (upstream) of the site. Sample pair 13SW3/13SE3 was collected at the eastern end (downstream) of the site. Sediment and surface water samples were analyzed for TCL VOCs, TCL SVOCs, PAHs, explosives (including nitroglycerin and PETN), perchlorate (surface water), and TAL inorganics.

Two soil samples were collected for physical testing including: percent moisture, grain size, pH, total organic content, specific gravity, and bulk density. One sample was also tested for Atterberg limits and hydraulic conductivity. Analytical results for these samples are presented in Appendix C.1.

<u>Human Health Risk Screening</u>

The human health risk screening portion of the SSP consisted of the following components:

1. Identification of chemicals of potential concern (COPCs) via comparison of maximum detected concentrations (MDCs) to adjusted R-RBCs and I-RBCs;
2. Cumulative human health risk screening;
3. Chemical specific screening for lead and iron;
4. MDC comparison to soil-to-groundwater site screening levels (SSLs) (dilution attenuation factor [DAF] 20); and
5. Metals MDC comparison to background point estimates.

Ecological Risk Screening

The ecological risk screening portion of the SSP consisted of the following components:

1. Problem formulation including identification of chemicals of potential ecological concern (COPECs);
2. Exposure assessment;
3. Ecological effects assessment; and
4. Risk characterization.

Summary of Results

As presented in WPA 023, the results of the SSP investigation resulted in the identification of lead as the primary COPC and COPEC requiring further investigation and assessment at the site due to detected concentrations in soil that were above the industrial SL and ecological benchmarks. Benzo(a)pyrene was also identified as a COPC in soil due to detected concentrations above its adjusted R-RBC. Zinc was identified as a COPEC due to its detection above its ecological benchmarks and background point estimate. The SSP resulted in the recommendation of a focused RFI for soil within the RFI study area and sediment within the adjacent New River. The RFI was to focus on lead in soil and metals in sediment.

SSP boring 13SB12 was located within the OBG operational area in a retention pond that has been reconfigured since the SSP sampling event under the Subpart X permit. Therefore, due to the location of the boring, as well as, the construction in the area that occurred since the SSP sampling event, this sample was excluded from the RFI assessment. In WPA 023 (URS 2008a) Appendix D.1.2, the SSP screening was revised excluding 13SB12 and utilizing USEPA Region III October 2007 RBCs (current RBCs at the time of workplan development), which resulted in the identification of the following human health COPCs: metals with lead above its facility background point estimate, benzo(a)pyrene, and nitroglycerin. Figure 2-9 shows the sample results for COPCs identified in the revised human health screening and original COPECs above their background point estimates (inorganics only).

2.2.5 New River Investigation and Sampling for SWMU 54 RFI – 2008

Sediment sampling was conducted in the New River in November 2006 concurrent with the RFI conducted at SWMU 54. Sediment samples were collected from 23 stations in the New River along a reach of approximately 5.9 miles; the reach extended from approximately 3.4 miles upstream of SWMU 54 to a location approximately 2.4 miles downstream of SWMU 54, as shown on Figure 2-10. Sample locations were selected based on a desktop assessment of flood plain and hydrologic data (to identify locations where sediment deposition occurs) and a field reconnaissance by boat conducted by representatives of URS, the Army, USEPA, U.S. Fish and Wildlife, and the VDEQ. The purpose of the sediment sampling was to evaluate potential releases to the New River from historical activities at SWMU 54 and to assess overall sediment quality in the RFAAP area.

Sediment samples were analyzed for explosives and TAL metals along with total organic carbon, pH, and grain size analysis. Eight of the 23 samples were collected upstream of the OBG (NR-SED-1 through NR-SED-8). Three samples were collected adjacent to the RFI study area (NR-SED-9 through NR-SED-11), two samples (NR-SED-12 and NR-SED-13) were collected downstream of the OBG and upstream of SWMU 54, and nine samples were collected downstream of the OBG and SWMU 54. Sample results are summarized in Table 2-5. Lead results for the samples are shown on Figure 2-10 and summarized by segment in the following table.

Summary of Lead Sample Results for Sediment

		Lead Concentrations (mg/kg)		
River Segment	**Stations**	**Minimum**	**Maximum**	**Mean**
Upstream of the OBG	NR-SED-1 – NR-SED-8	43	160	87
Adjacent to RFI Study Area	NR-SED-9 – NR-SED-11	120	280	197
Downstream of the OBG and Upstream of SWMU 54	NR-SED-12 – NR-SED-14	86	100	105
Adjacent to SWMU 54	NR-SED-15	190	190	190
Downstream of the OBG, SWMU 54, and MMA	NR-SED-16 – NR-SED-23	82	500	198
Entire Segment Sampled	NR-SED-1 – NR-SED 23	43	500	147

As shown in Figure 2-10 and in the above table, lead concentrations in New River sediment are below the human health residential SL of 400 mg/kg, with the exception of station NR-SED-16 (500 mg/kg) located downstream of the OBG, SWMU 54, and the RFAAP MMA. The mean concentration of lead for each sub-segment sampled and the entire reach sampled was below 400 mg/kg. Detected lead concentrations in each sample were above the BTAG sediment screening value of 35.8 mg/kg.

2,4-Dinitrotoluene (2,4-DNT) was detected in the sediment sample NR-SED-8 collected across the New River (on the opposite river bank) from the western edge of the OBG at a concentration (1.4 mg/kg) above its BTAG sediment screening value but below its adjusted R-RBC. 2,4,6-Trinitrotoluene (2,4,6-TNT) was detected in sediment sample NR-SED-10 collected adjacent to the RFI study area at a concentration (0.24 mg/kg) above its BTAG sediment screening value but below its adjusted R-RBC. Explosives were not detected in the other sediment samples collected from the New River.

The SWMU 54 RFI/CMS Report (URS 2008b) concluded that attributing lead and other metals detected in sediment samples to a specific source or sources is not possible for the RFI given the complex transient flow and depositional patterns in the river, and therefore, it is recommended that these data be used holistically as part of any overall evaluations of the facility and potential receptors conducted for the RCRA Corrective Action Permit.

Notes:

CAS = Chemical Abstracts Service
mg/kg = Milligram Per Kilogram
TAL = Target Analyte List
TCL = Target Compound List
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
NT = Not Tested
RBC = USEPA Region III Risk-Based Concentration (RBC) values from the October 11, 2007, RBC Table and Alternate RBC Table
Adjusted RBCs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
C/N = Carcinogenic/Noncarcinogenic per EPA RBC Table (October 2007)
SSL DAF1 = Soil Screening Levels at a Dilution Attenuation Factor of 1
[1] = Chromium VI RBC value was used
[2] = Lead criteria are Action Levels; see USEPA Region III guidance
[3] = Noncarcinogenic Residential and Industrial RBC values for 2,4,6-Trinitrotoluene were used for screening
[4] = Action Levels as defined in the Open Burning Ground permit
[6] = 2,3,7,8-TCDD TEQs calculated utilizing revised toxicity equivalency factors (TEFs) (WHO 2005)

QL/RL = Quantitation Limit/Reporting Limit
J = Denotes analyte reported at or above QL/RL and associated result is estimated
U = Denotes analyte not detected at or above QL/RL
UJ = Denotes analyte not detected at or above QL/RL and QL/RL is estimated

= Concentration exceeds Adjusted Residential RBC

= Concentration exceeds Adjusted Industrial RBC

bold italic = Concentration exceeds Action Level

underline = Concentration exceeds Facility-Wide Background Point Estimate

3.0 FIELD INVESTIGATION PROGRAM

The field investigation program for the RFI conducted at the RFI study area included a soil investigation as outlined in the following sections.

3.1 SAMPLING AND ANALYSIS

The RFI and SSP sampling and analysis plan is summarized in Table 3-1; this table identifies the boring locations, chemical and physical sample locations and depths, and analytical methods and parameters. Figures 3-1a and 3-1b show the soil sample locations for the RFI and SSP investigations.

3.1.1 Soil Borings and Soil Sampling

Five direct push borings and 80 hand auger borings were completed to characterize soil conditions at the RFI study area. Soil boring locations are shown on Figures 3-1a and 3-1b, provided in Table 3-1, and summarized below.

Soil Sampling and Analysis

Date/Event	Soil Sample Locations	Analytical Parameters	Comments
October 2003 (SSP)	***Soil Borings:*** 13SB7 through 13SB11	TAL Metals, TCL VOCs, TCL SVOCs, TCL PAHs, TCL PCBs (selected samples), TCL Pesticides and Herbicides (selected samples), Explosives, and Nitroglycerin/PETN.	Assess the nature and extent of COPCs in soil within the RFI study area.
	Physical/Geotechnical Properties: 13SB7 and 13SB10	Moisture content, Atterburg Limits, grain size, pH, organic content, specific gravity, bulk density, and hydraulic conductivity.	Geotechnical and physical property analysis.
November/ December 2008 (RFI)	***Soil Borings:*** 13SB13 through 13SB92	Lead	Assess the nature and extent of lead within the RFI study area and to provide sufficient data for risk assessment.
	Soil Borings: 13SB13 through 13SB22	TAL Metals, TCL SVOCs, Explosives, and Nitroglycerin/PETN.	Assess the nature and extent of chemicals within the RFI study area and to provide sufficient data for risk assessment.
	Physical/Geotechnical Properties: 13SB13, 13SB16, 13SB18, 13SB19, 13SB15 (TOC only), and 13SB20 (TOC only)	Moisture content, Atterburg Limits, grain size, pH, total organic carbon (TOC), and cation exchange capacity.	Geotechnical and physical property analysis.

For the RFI, 80 soil borings (13SB13 through 13SB92) were completed within the RFI study area using hand augers. RFI soil borings were completed within the RFI study area to a maximum depth of 6 ft bgs. One to three soil samples were collected from each boring from various intervals dependant on field conditions (i.e., depth of refusal or depth to groundwater). Soil samples were analyzed for lead. Selected

soil samples were analyzed for TAL Metals, TCL SVOCs, explosives, and nitroglycerin/PETN. Additionally, seven samples were collected from soil borings listed in the table above for physical testing. Three of the samples were analyzed for a full suite of analysis including moisture content, Atterburg Limits, grain size, pH, total organic carbon, and cation exchange capacity. Four other samples were analyzed for total organic carbon and/or cation exchange capacity. Physical test results are summarized in Table 2-1 and the complete results are presented in Appendix C.1.

3.2 QUALITY ASSURANCE

Quality Assurance (QA) planning defined the overall system of activities for assuring the reliability of data produced. The system integrated the quality planning, assessment, and corrective actions of various groups in the organization to provide the independent QA program necessary to establish and maintain an effective system for collection and analysis of environmental samples and related activities. The program encompasses the generation of complete data with its subsequent review, validation, and documentation.

The accuracy and integrity of RFI data were ensured through the implementation of internal quality control (QC) measures consistent with WPA 023 (URS 2008a). QA and QC procedures, including field QC, laboratory QC, data management, and data validation, were integrated into the investigation program to meet data quality objectives (DQOs) established and approved for the RFI. The data were evaluated for each of the DQO indicators and the results of this evaluation are presented in Appendix H.1. DQOs for the RFI were met.

3.3 INVESTIGATION METHODOLOGY

3.3.1 Soil Sampling for Chemical Analysis

A soil sampling grid was established within the RFI study area to assess the spatial distribution of lead in soil following the procedures outline in SOP 30.7 (Appendix B) for systematic grid sampling. Data was collected on a central aligned rectangular grid to provide coverage across the entire RFI study area. A rectangular sample grid was used to cover the elongated rectangular shape of the site, with approximate 50 ft sample spacing in the east to west direction and 20 ft sample spacing in the north to south direction as shown on Figures 3-1a and 3-1b. Eighty sample point locations were located on the grid, with two or three rows of samples between the OBG perimeter berm and the New River depending on the RFI study area width in the north to south direction.

Surface and subsurface soil samples were collected for chemical analysis following the procedures outlined in standard operating procedure (SOP) 30.1 included in Appendix B and as described in Section 5.2 of the MWP (URS 2003). Stainless steel hand augers were used to collect both surface and subsurface soil samples. Hand augers were decontaminated between sampling locations following the procedures outlined in SOP 80.1 (Appendix B) to prevent potential cross-contamination. Soil sampling information was documented in the field logbooks and on sample forms as described in SOPs 10.1 and 10.2 included in Appendix B. Completed soil sample forms are presented in Appendix C.3.

Soil samples were processed following the procedures outlined in SOP 50.1 for labeling, SOP 10.4 for chain of custody, and SOP 50.2 for sampling packing for shipping. Appropriately, label the samples (SOP 50.1), complete the chain-of-custody (SOP 10.4), and package the samples for shipping (SOP 50.2).

3.3.2 Site Surveying

Horizontal coordinates and ground surface elevations for sample locations were obtained using a Trimble Pathfinder Pro XRS® global positioning system (GPS) unit with submeter accuracy for horizontal measurements (+1 part per million) and vertical measurements (+2 parts per million). Surveying was conducted using the U.S. State [Virginia (South Zone)] Plane Coordinate System (measured in U.S. survey ft) using the North American Datum 1983. The sampling grid was surveyed and locations flagged prior to completing soil sampling.

3.3.3 Investigation-Derived Material (IDM) Management

IDM management activities were conducted consistent with the procedures outlined in WPA 023 (URS 2008a) and documented in the field logbook, and conducted as described below.

3.3.3.1 Accumulation

IDM accumulated during soil sampling included the following materials and containers:

- Decontamination water – one 55-gallon drum.

IDM accumulation and labeling was conducted as outlined in MWP SOP 70.1 (Appendix B). The drum was transferred to the Installation's approved container accumulation area at SWMU 17 while this IDM was on hold pending analysis for characterization and disposal.

3.3.3.2 Material Characterization

An IDM characterization sample was collected for the decontamination water generated during the investigation to allow for disposal in the RFAAP Process Water Treatment Plant. The characterization sample was analyzed for pH, chemical oxygen demand, and Toxicity Characteristic Leaching Procedure metals as required by RFAAP. IDM sample results are presented in Appendix C.4.

3.3.3.3 Decontamination Water

Following the waste characterization sample analysis, the Installation and RFAAP Process Water Treatment Plant engineers were provided a copy of the water IDM sample results. After receiving Plant approval, decontamination water was discharged into the collection system of the Process Water Treatment Plant.

3.4 WORK PLAN FIELD CHANGES

The sampling grid consisted of 80 sampling points rather than the 77 sampling points estimated in the work plan based on actual field conditions encountered during layout of the sampling grid. Consistent with WPA 023, two or three samples were collected from each sampling point depending on the conditions encountered (depth to refusal or groundwater). The maximum depth of sampling during the investigation (6 ft bgs) was consistent with the anticipated depth identified in WPA 023. Sample location coordinates are provided in Appendix C.5.

Shallow refusal depths were encountered at several planned boring locations. A soil digging bar was used to deepen hand auger borings if possible or the borings were offset slightly in an attempt to verify conditions or achieve a greater depth if possible. At approximately 10 percent of the total sample locations, the borings could not be extended substantially below the depth of the surface sampling interval to collect planned subsurface soil samples. The slight bias in the number of surface samples relative to subsurface samples is not considered to represent a significant constraint in achieving investigation objectives, given the likely historical release mechanisms from the adjacent OBG (surface release mechanisms rather than subsurface disposal) and low mobility of lead in soil that would tend to bias higher concentrations in surface soil.

NA = Not Applicable
ASTM = ASTM International

4.0 NATURE AND EXTENT OF CHEMICALS

The following sections discuss the results of chemical sampling of soil at the site and assess the nature and extent of detected chemicals in site media. Chemical results are evaluated with respect to the following: USEPA Region III residential risk-based screening levels (R-RSLs) and industrial risk-based screening levels (I-RSLs) for soil (USEPA 2008), which are adjusted downward for non-carcinogenic chemicals to an HQ of 0.1 to account for potential additive toxicity effects of multiple chemicals; the most current USEPA Region III ecological soil screening levels (as presented in Section 7.0); and facility-wide background concentrations for metals in soil as provided below (IT 2001).

Facility-Wide Point Estimates for Soil

Chemical	Minimum Concentration (mg/kg)	Maximum Concentration (mg/kg)	95% Upper Tolerance Limit (UTL) of the Mean (mg/kg)
Aluminum	3,620	47,900	40,041
Arsenic	1.2	35.9	15.8
Barium	23.4	174	209
Beryllium	0.61	5.4	1.02
Cadmium	0.62	2.5	0.69
Chromium	6.3	75.8	65.3
Cobalt	5.9	130	72.3
Copper	1.6	38.7	53.5
Iron	7,250	67,700	50,962
Lead	2.1	256	26.8
Manganese	16.7	2,040	2,543
Mercury	0.038	1.2	0.13
Nickel	4.6	94.2	62.8
Thallium	1.3	5	2.11
Vanadium	12.2	114	108
Zinc	4.7	598	202

Note: mg/kg = Milligram per kilogram

With the exception of metals in soil, chemicals detected in one or more samples in a given medium at concentrations above their adjusted RSLs or ecological screening levels are identified in the nature and extent assessment as COPCs. Metals in soil detected at concentrations above their background point estimates and an adjusted RSL or ecological screening value are retained as COPCs in the nature and extent assessment. The facility-wide background concentrations are used in the nature and extent assessment to evaluate the significance of background concentrations in soil and to assist in bounding the lateral and vertical extent of metals concentrations potentially attributable to historical site activities. Additional chemical specific screening information is provided below.

Note that for some explosives (i.e., DNT) with regard to human health, the carcinogenic toxicity data available for DNTs (i.e., 2,4-DNT and 2,6-Dinitrotoluene [2,6 DNT]) applies to the DNT mixture; therefore, the concentrations detected for 2,4-DNT and 2,6-DNT for each sample are summed and this value is screened against the carcinogenic RSL. Non-carcinogenic RSLs are available for both 2,4-DNT

and 2,6-DNT; therefore, they are screened independently against the adjusted non-carcinogenic RSLs. If one compound is detected in the sample and the other compound is not, one half the detection limit of the non-detect is averaged with the detected result.

4.1 ANALYTICAL RESULTS

Ninety-two surface soil samples and 91 subsurface soil samples for a total of 183 samples were collected for chemical analysis from the RFI study area (Figures 3-1a and 3-1b and Table 3-1). Soil samples for chemical analysis were collected from borings from various intervals. Tables 4-1 and 4-2 present analytical results for chemicals detected in soil samples collected at the RFI study area and screens these data with respect to adjusted RSLs and background concentrations. Table 4-3 summarizes the screening results for soil data including: constituents detected, minimum and maximum concentrations detected, number of detections, number of samples, and number of samples above human health screening criteria and background concentrations (inorganics only). COPECs listed below were identified for the site as part of the refined screening level ecological risk assessment presented in Section 7.7 and above background point estimates (inorganics only). The screenings resulted in the identification of the following COPCs and COPECs (note that chemicals which were above industrial screening levels are italicized):

TAL Metals (Methods 6010B, 6020A, 7471A) – 23 TAL metals were detected in soil samples with the following metals detected at concentrations above SLs:

RSL – antimony, *iron*, *lead*, thallium; and
Eco – none.

TCL Pesticides (Method 8081A) – No pesticides were detected in the SSP soil samples tested for pesticides. Additional soil samples collected as part of the RFI investigation were not analyzed for pesticides in accordance with WPA 023.

TCL PCBs (Method 8082) – No PCBs were detected in the SSP soil samples tested for PCBs. Additional soil samples collected as part of the RFI investigation were not analyzed for PCBs in accordance with WPA 023.

TCL VOCs (Method 8260B) – Additional soil samples collected as part of the RFI investigation were not analyzed for VOCs. 8 VOCs were detected in SSP soil samples with the following VOCs detected at concentrations above SLs:

RSL – none; and
Eco – none.

TCL SVOCs (Method 8270C) – 32 SVOCs were detected in soil samples with the following SVOCs detected at concentrations above SLs:

RSL – benzo(a)anthracene, *benzo(a)pyrene*, benzo(b)fluoranthene, dibenz(a,h)anthracene; and
Eco – none.

Explosives (Method 8330) and Nitroglycerin (Method 8332) – 5 explosives and nitroglycerin were detected in soil samples with the following constituents detected at concentrations above SLs:

RSL – *nitroglycerin*; and
Eco – none.

Dioxin/Furans (Method 8290) – Additional soil samples collected as part of the RFI investigation were not analyzed for dioxin/furans. Dioxin/furans were detected in SSP soil samples with the following concentrations above SLs:

RSL –none; and
Eco – none.

4.2 HUMAN HEALTH NATURE AND EXTENT ASSESSMENT

A summary of the human health risk and background screening results for COPCs is presented in the table below.

Summary of COPCs for Soil

Chemical	Total # of Det/# of Samples	Surface Soil Samples (0- 1 ft bgs) Above RSLs		Subsurface Soil Samples (> 1 ft bgs) Above RSLs	
		# Above R-RSL/I-RSL	Sample ID	# Above R-RSL/I-RSL	Sample ID
Antimony	27/32	0/0	NA	1/0	13SB11B
Iron	32/32	1/1	**13SB19A**	1/1	**13SB21C**
Lead	183/183	11/3	**13SB8A**, 13SB9A DUP AVG, 13SB19A, **13SB33A**, 13SB38A, 13SB45A, 13SB56A, 13SB62A DUP AVG, **13SB63A**, 13SB70A, 13SB78A	10/3	**13SB11B**, 13SB25B, **13SB25C**, 13SB38B DUP AVG, 13SB42B, 13SB44C, 13SB48C, 13SB56B DUP AVG, **13SB61B**, 13SB80B
Thallium	32/32	1/0	13SB19A	0/0	NA
Benzo(a)anthracene	25/32	1/0	13SB9A DUP AVG	1/0	13SB22C
Benzo(a)pyrene	29/32	11/0	13SB7A, 13SB8A, 13SB9A DUP AVG, 13SB10A, 13SB11A, 13SB16A, 13SB17A, 13SB18A, 13SB20A, 13SB21A, 13SB22A	8/1	13SB8B, 13SB9B, 13SB10B, 13SB10C, 13SB16C, 13SB17C, 13SB20C, **13SB22C**
Benzo(b)fluoranthene	29/32	5/0	13SB8A, 13SB9A DUP AVG, 13SB17A, 13SB20A, 13SB22A	1/0	13SB22C
Dibenz(a,h)anthracene	14/32	5/0	13SB8A, 13SB9A DUP AVG, 13SB16A, 13SB20A, 13SB22A	2/0	13SB10B, 13SB22C
Nitroglycerin	6/32	1/0	13SB11A	4/1	13SB9B, 13SB10C, 13SB11B, **13SB13C**

Notes: NA=Not Applicable, DUP AVG = Duplicate Average, **Bold**=Sample Above adjusted R-RSL and I-RSL

The nature and extent of COPCs identified in the above table is discussed further in the following sections.

4.2.1 Antimony

Antimony was detected in one sample (13SB11B at 4.5 to 5 ft bgs) at a concentration above its adjusted R-RSL (no background point estimate is available for antimony). Samples collected at surface and terminal depths at boring 13SB11 had antimony concentrations below the adjusted R-RSL. Detected concentrations of antimony were below its adjusted I-RSL.

4.2.2 Iron

Iron was detected in one surface sample (13SB19A) and one subsurface sample (13SB21C) at concentrations above its adjusted R-RSL, I-RSL, and background point estimate. The subsurface sample

collected from 1.5 to 1.8 ft bgs at boring 13SB19 had an iron concentration below the adjusted R-RSL and background point estimate.

4.2.3 Lead

As outlined in the COPC summary table above, lead was detected at concentrations above its R-RSL and background point estimate in 21 of 183 samples and above its I-RSL and background point estimate in six samples. Figures 4-1a and 4-1b show the concentrations of lead detected in soil within the RFI study area and identify sample locations where lead was detected at concentrations above the R-RSL and I-RSL. The majority of the 17 sample locations with lead concentrations above RSLs occur at discrete locations that are along or proximate to the perimeter berm of the OBG. Seven of the 17 sample locations are closest to Burn Pan No. 6. The mean concentration of lead detected in surface soil with the RFI study area was 313.9 mg/kg, with a mean concentration of 414.9 mg/kg for all samples collected from the surface and subsurface intervals (Appendix D).

The highest lead concentrations were identified in surface sample 13SB8A (8,620 mg/kg) and intermediate depth subsurface sample 13SB11B (26,500 mg/kg). The subsurface sample collected at boring 13SB8 from 3.5 to 3.7 ft bgs had a lead concentration (46 mg/kg) below its R-RSL. The surface sample and terminal samples at 13SB11 had lead concentrations below its R-RSL (111 mg/kg and 295 mg/kg, respectively).

4.2.4 Thallium

Thallium was detected in one surface sample (13SB19A) at a concentration above its adjusted R-RSL and background point estimate. The subsurface sample collected from 1.5 to 1.8 ft bgs at boring 13SB19 had a thallium concentration below the adjusted R-RSL and background point estimate. Detected concentrations of thallium were below its adjusted I-RSL.

4.2.5 Pesticides

Pesticides were not detected in SSP soil samples; therefore, no additional samples were analyzed for pesticides as part of the RFI in accordance with WPA 023.

4.2.6 PCBs

PCBs were not detected in SSP soil samples; therefore, no additional samples were analyzed for PCBs as part of the RFI in accordance with WPA 023.

4.2.7 VOCs

VOCs were detected in SSP samples at concentrations below their adjusted RSLs. No additional samples were analyzed for VOCs as part of the RFI in accordance with WPA 023.

4.2.8 SVOCs

As presented on Figures 4-2a and 4-2b and as outlined in the table above, SVOC compounds benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenz(a,h)anthracene (high molecular weight PAH compounds) were detected in one or more of the 32 samples collected at concentrations above their adjusted R-RSLs. Benzo(a)pyrene was detected in one sample (13SB22B) at a concentration (290 µg/kg) above its I-RSL of 210 µg/kg.

4.2.9 Explosives and Nitroglycerin

Explosives analyzed for by Method 8330 were detected in samples at concentrations below their adjusted RSLs. Nitroglycerin was detected in 5 of 32 samples (13SB9B, 13SB10C, 13SB11A, 13SB11B, and

13SB13C) at concentrations above its adjusted R-RSL, as shown on Figures 4-2a and 4-2b. The concentration of nitroglycerin detected in sample 13SB13C (21 mg/kg) was also above its I-RSL.

4.2.10 Dioxins

Additional soil samples collected as part of the RFI investigation were not analyzed for dioxin/furans in accordance with WPA 023. Dioxin/furans were detected in the SSP soil sample at a concentration below its RSLs.

4.3 ECOLOGICAL NATURE AND EXTENT ASSESSMENT

As presented in Section 7.7, after consideration of the results of the SLERA, background concentrations, site conditions, and nature of the material in place at the site, the scientific management decision point (SMDP) is the following:

There is adequate information to conclude that ecological risks are not significant and therefore there is no need for further action at the site on the basis of ecological risk.

4.4 NATURE AND EXTENT SUMMARY

Lead is the primary site-related COPC in soil within the RFI study area and the presence of lead above background levels is likely attributable to historical activities at the adjacent OBG. Other COPCs identified in soil include antimony, iron, thallium, four PAH compounds, and nitroglycerin. Detected concentrations above I-RSLs were limited to 6 of 183 samples for lead and one sample each for iron, nitroglycerin, and benzo(a)pyrene. Although PAHs and nitroglycerin were detected in soil at concentrations above screening levels, PAHs and nitroglycerin were not identified as risk or hazard drivers in the human health and ecological risk assessments (Sections 6.0 and 7.0).

The majority of sample locations with lead concentrations above RSLs occur at discrete locations that are along or proximate to the perimeter berm of the OBG. Approximately 40% of these locations are closest to Burn Pan No. 6 in the western portion of the OBG area (See Figures 3-1a and 3-1b for pad/pan locations). The mean concentration of lead in surface soil with the RFI study area is 313.9 mg/kg, which is below the R-RSL.

Although previous sediment sampling results (Section 2.2.5) did not indicate the site had historically significantly affected the New River based on the detected lead concentrations at the study area, an assessment of the study area as a potential future source of lead loading in the New River was conducted. The site area assessed is limited to the 1.6 acre study area. The presence of the OBG berm along the northern edge of the study area prevents runoff from adjacent areas to the north from entering the study area (Section 2.1.3). Soil losses were calculated as described below.

The Revised Universal Soil Loss Equation (RUSLE) is an erosion model predicting longtime average annual soil loss resulting from raindrop splash and runoff. As presented in Calculation #1 in Appendix C.6, the potential average annual soil loss for the site is 0.9 tons containing a total of 0.26 kg of lead per year. Based on the average flow of the river (3,258 ft^3/sec) and the minimal mass of lead potentially transported to the river over the course of a year, the potential soil loss is not considered to present a significant future risk to the New River.

In addition to calculating potential annual soil loss for the site, soil losses were calculated for an individual storm event using a method called the Modified Universal Soil Loss Equation (MUSLE), which allows for the calculation of sediment yields for individual storm events. As presented in Calculation #2 in Appendix C.6, a potential sediment yield for a 10-year storm was calculated for the site assuming all eroded soil from the site was discharged to the river (i.e., no delivery ratio was used). A 10-year storm resulted in a potential soil loss for the site of 0.3 tons containing a total of 0.09 kg of lead per storm event. Considering mixing of the runoff from the storm event (peak flow of 4.35 ft^3/sec) and the

average flow of the New River (3,258 ft^3/sec), as well as, the minimal mass of lead potentially transported to the river via soil loss, the potential soil loss is not considered to present a significant future risk to the New River.

Based on the previous sediment sampling results and the results of the annual and 10-year storm event soil loss assessments, potential RFI study area related releases to the New River are not considered to pose current or future significant risk to the river.

As presented in Sections 6.0 and 7.0, the human health and ecological risks assessments did not identify lead or other COPCs as risk drivers for potential receptors at the site.

Notes:
CAS = Chemical Abstracts Service
ft bgs = Feet Below Ground Surface
mg/kg = Milligram Per Kilogram
µg/kg = Microgram Per Kilogram
pg/g = Picogram Per Gram
TAL = Target Analyte List
TCL = Target Compound List
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
PAH = Polynuclear Aromatic Hydrocarbon
PETN = Pentaerythritol Tetranitrate
MDL = Method Detection Limit
RL = Reporting Limit
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code
NT = Not Tested

[A] = Facility-Wide Background Point Estimate as Reported in the Facility-Wide Background Study Report (IT 2001)
RSL = Regional Screening Level (RSL) from October 2008 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
Key: c = cancer
n = noncancer
* = where: n SL < 100X c SL
** = where n SL < 10X c SL
m = concentration may exceed ceiling limit
s = concentration may exceed Csat

-- = No Screening Value Available

[1] = Mercuric chloride soil RSL value used
[2] = 3-Methylphenol RSLs used
[3] = Pyrene RSLs used
[4] = Noncarcinogenic Residential RSL value for 2,4,6-Trinitrotoluene was used for screening

= Concentration Exceeds Adjusted Soil Residential RSL

= Concentration Exceeds Adjusted Soil Industrial RSL

underline = Concentration Exceeds Facility Background Values

Data Qualifiers:

Laboratory Qualifiers
- B Analyte found in associated blank as well as in the sample.
- J Estimated value.
- E Concentration exceeded the upper level of the calibration range of the instrument for that specific analysis. For TICs, compound not present in calibration standard, calculated using total peak areas ion chromatographs and response factor of 1.
- U The compound was analyzed for but not detected. The reporting limit will be adjusted to reflect any dilution, and for soil, the percent moisture.
- A Amount detected is less than the Lower Calibration Limit.

Validation Qualifiers
- B Not detected substantially above the level reported in laboratory or field blanks.
- N Tentative Identification. Consider present. Special methods may be needed to confirm its presence or absence in future sampling efforts.
- J Analyte present. Reported value may not be accurate or precise.
- K Analyte present. Reported value may be biased high. Actual value is expected to be lower.
- L Analyte present. Reported value may be biased low. Actual value is expected to be higher.
- U Not detected. The associated number indicates the approximate sample concentration necessary to be detected.
- UJ Not detected, quantitation limit may be inaccurate or imprecise.
- UL Not detected, quantitation limit is probably higher.

Reason Codes
GC/MS Organics
- c Calibration failure; poor (RRF) or unstable (%D) response
- d MS/MSD or LCS/LCSD RPD imprecision
- f Field duplicate imprecision
- l MS/MSD recovery failure
- m Internal standard failure
- q Concentration exceeded the linear range
- s Surrogate failure
- t Tentatively identified Compound
- x Field and/or equipment blank contamination
- z Method blank and/or storage blank contamination

Inorganics and Conventionals
- m MS/MSD recovery failure
- p Preparation blank contamination
- s Serial dilution failure
- x CRDL standard recovery failure

GC and HPLC Organics
- f Field du[licate imprecision
- g Dual column confirmation imprecision

Notes:
ft bgs = Feet Below Ground Surface
mg/kg = Milligram Per Kilogram
MDL = Method Detection Limit
RL = Reporting Limit
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code

Data Qualifiers:
J = Analyte present. Reported value may not be accurate or precise.
K = Analyte present. Reported value may be biased high. Actual value is expected to be lower.
L = Analyte present. Reported value may be biased low. Actual value is expected to be higher.
f = Field duplicate imprecision
m = MS/MSD recovery failure

= Concentration Exceeds Adjusted Soil Residential RSL of 400 mg/kg

= Concentration Exceeds Adjusted Soil Industrial RSL of 800 mg/kg

underline = Concentration Exceeds Facility Background Value of 26.8 mg/kg

Notes:

COPC = Chemical of Potential Concern
mg/kg = Milligram Per Kilogram
CAS = Chemical Abstracts Service
TAL = Target Analyte List
TCL = Target Compound List
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
PETN = Pentaerythritol Tetranitrate
RSL = Regional Screening Level (RSL) from October 2008 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
-- = No Value Available
R-RSL = Adjusted Residential RSL
I-RSL = Adjusted Industrial RSL

[A] = For inorganics, number of samples that exceed background (if available) and screening level
[1] = Mercuric chloride soil RSL value used
[2] = 3-Methylphenol RSLs used
[3] = Pyrene RSLs used
[4] = Noncarcinogenic Residential RSL value for 2,4,6-Trinitrotoluene was used for screening

Key per October 2008 Regional RSL Table:
c = cancer
n = noncancer
c* = cancer where n SL < 100X c SL
c** = cancer where n SL <10X c SL
m = concentration may exceed ceiling
s = concentration may exceed Csat

5.0 FATE AND TRANSPORT ASSESSMENT

This section discusses the fate and transport of site-related COPCs. Primary fate and transport mechanisms occurring at the site are discussed. The objective of the fate and transport analysis is to identify the primary mechanisms affecting the distribution and migration of COPCs and their ultimate fate. COPCs identified at the site are summarized in the following table.

Site COPCs from Nature and Extent Assessment

Soil – Human Health		Soil to Groundwater SL DAF 10 (Section 5.1.4)	
Antimony	Benzo(a)anthracene	Iron	Benzo(a)pyrene
Iron	Benzo(a)pyrene	Lead*	Benzo(b)fluoranthene
Lead	Benzo(b)fluoranthene	Thallium	2,4,6-Trinitrotoluene (TNT)
Thallium	Dibenz(a,h)anthracene	Trichloroethene (TCE)	2,6-Dinitrotoluene (DNT)
Nitroglycerin		Benzo(a)anthracene	Nitroglycerin

Note: *Although lead does not have a risk based SSL it is included in the evaluation due to the nature of the site.

The potential for transport of chemicals in environmental media is largely controlled by the physiochemical properties of the chemicals and the matrix through which they travel or migrate. Table 5-1a describes the physiochemical properties of chemicals that affect their fate in environmental media. Table 5-1b describes the fate processes affecting metals including: ion exchange, chemical speciation, and oxidation-reduction potential. Table 5-1c describes the fate processes affecting organic chemicals including: sorption, volatilization, hydrolysis, and abiotic and biotic degradation. Chemicals can be transported with little attenuation or retardation due to these fate processes or they can be delayed or transformed so that minimal migration occurs. The physical and chemical properties of organic COPCs detected in soil are summarized in Table 5-2.

Primary fate and transport mechanisms for COPCs potentially present at the site include the following:

- Volatilization of chemicals from soil;
- Erosion of particulate-bound chemicals from soil;
- Degradation of chemicals in soil;
- Leaching of chemicals from soil with infiltrating water; and
- Transport of chemicals with groundwater flow.

Fate and transport processes for site media are discussed in the following sections.

5.1 FATE AND TRANSPORT - SOIL

Fate and transport processes for soil are discussed in the following sections including volatilization, erosion and mass transport, and degradation of chemicals in soil, and leaching of chemical from soil with infiltrating water.

5.1.1 Volatilization

Volatilization can significantly affect the distribution of a chemical in the environment. This process will result in the mass and concentration of a chemical in soil as the chemical volatilizes to soil gas and ultimately discharges to the atmosphere. Volatilization reactions are most significant in surface soil that is in direct (or near-direct) contact with the atmosphere. Chemical volatility is typically quantified by a chemical's Henry's constant, which may be calculated from the chemical's vapor pressure, molecular weight, and solubility. The lower the Henry's constant, the less volatile the chemical. Values of Henry's constant for soil COPCs are summarized in Table 5-2.

One VOC (TCE) and one SVOC (naphthalene) with Henry's constants less than 0.1 were identified as COPCs for the soil-to-groundwater migration pathway based on detections in one or more samples above calculated site-specific SLs (Section 5.1.4). Low concentrations of these COPCs have been detected in soil and therefore, volatilization is not expected to be a significant influence on the fate of this compound in soil. Other COPCs at the site are characterized by low Henry's constants (i.e., < 0.01) and are not considered highly volatile, and therefore, volatilization is not expected to be a significant influence on the fate of these compounds at the site.

5.1.2 Erosion Processes in Soil

Erosion processes can substantially affect the distribution of soil-bound particulates in the environment and thus influence the distribution of constituents in soil. High winds can scour fine particles from the soil surface and redistribute these particles downwind. Mass transport from surface water runoff during heavy precipitation events can also scour fine soil particles from surface soil, eventually depositing the particles during sedimentation downstream. As presented in Section 4.4, this potential migration pathway is impeded by the presence of significant vegetation in the RFI study area. Section 4.4 presents a quantitative evaluation of soil erosion in the RFI study area with respect to potential lead transport to the adjacent New River by erosion processes. The results of this evaluation indicated that minimal mass of lead would be potentially transported to the river by erosion processes and the potential soil loss is not considered a significant future risk to the New River.

5.1.3 Degradation of Chemicals in Soil

Many organic chemicals that are found in the environment are subject to naturally occurring biotic (biologically based) and abiotic (non-biologically based) transformation reactions. These reactions result in degradation of the chemical. Biodegradation reactions can occur under aerobic (in the presence of oxygen) and anaerobic (in the absence of oxygen) conditions. During biodegradation, naturally occurring microorganisms in the subsurface transform a chemical to another state as a direct or indirect consequence of their metabolic processes. In many cases, biodegradation reactions break down organic chemicals to less toxic forms.

Several naturally occurring abiotic reactions can significantly affect the fate of chemicals in the environment. Common abiotic reactions include photodegradation and hydrolysis. Photodegradation is the process of decomposition of a chemical upon exposure to radiant energy such as the action of light, and is most significant to chemicals in surface soil that are in direct contact with sunlight. Hydrolysis is the degradation reaction of the chemical with components of water (e.g., hydroxyl and hydronium ions) and is therefore most important in saturated environments.

5.1.3.1 Metals

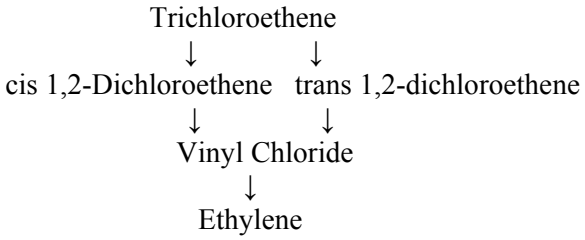
Metal COPCs, such as antimony, iron, lead, and thallium will not be significantly influenced by degradation processes in soil.

5.1.3.2 VOCs

VOCs were detected low concentrations in soil at the site. The VOC COPC identified for the soil-to-groundwater migration pathway was TCE.

TCE: TCE was detected in 3 of 14 samples at low level concentrations. TCE is resistant to aerobic degradation in soil although biodegradation may proceed co-metabolically. Under anaerobic conditions, TCE is slowly biodegraded through reductive dechlorination, with the extent and rate of degradation dependant on the degree of the reducing environment. The reductive dechlorination pathway for TCE is shown below. Vinyl chloride is an intermediate degradation by product in this pathway as shown below; this compound has not been detected at the site. Ethylene is an end- product of this degradation process.

TCE Degradation Pathway – Reductive Dechlorination



5.1.3.3 SVOCs

SVOCs identified as COPCs in soil at the site consisted of high molecular weight PAH compounds benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, and naphthalene (soil to groundwater). Microbial metabolism is the primary process for degradation of PAHs in soil. Hydrolysis, oxidation reduction, and photodegradation are not considered important processes for the degradation of PAHs in soil. The higher molecular weight PAHs that are COPCs at the site will tend to have lower rates and degrees of degradation than middle to lower molecular weight PAHs. The rate and extent of biodegradation of PAHs in soil is also influenced by soil properties such as organic content, structure, particle size, pH, temperature, and oxygen content, and the characteristics of microbial populations in the soil. The presence of metals in soil that are toxic to microorganisms will impede degradation (ATSDR 1995).

Experimentally reported half-lives for high molecular weight PAHs in soil are typically in the range of 1 to 1.5 years but will vary depending soil and site characteristics. Specific information on the relative degradation rates of PAHs in site soil is not available; it is possible that some degradation of PAHs has occurred at the site given the low concentrations of high molecular weight compounds detected. The presence of lead in soil is not expected to have an adverse impact on PAH degradation given the low-levels or absence of detectable levels of PAHs in soil.

5.1.3.4 Explosives – 2,4,6-TNT, 2,6-DNT, and Nitroglycerin

Explosive compounds identified as COPCs in soil include: 2,4,6-TNT (soil to groundwater only), 2,6-DNT (soil to groundwater only), and nitroglycerin.

2,4,6-TNT transformation generally occurs by sequential reduction of nitro groups to amino groups. 2,4,6-TNT is readily reduced in soil under anaerobic conditions, with sequential microbial transformations producing 4ADNT and 2ADNT and other degradation by products. Recent studies indicate that 2,4,6-TNT can be degraded under aerobic conditions with production of amino DNT and other degradation byproducts. There is some data to suggest that 2,4,6-TNT in uppermost layers of surface soil may be photolyzed to trinitrobenzene and trinitrobenzaldehyde (HSDB 2009). The half lives of 2,4,6-TNT in soil have been reported as ranging from 4 to 10 years, with a microbial oxidative decomposition rate of 0.017 to 0.05 percent per day (Cataldo et al 1989).

2,6-DNT is an impurity of TNT and may undergo some degradation in soil by microorganisms with a reduction of the nitro group to form amino groups including 4-amino-2-nitrotoluene and 2-amino-4-nitrotoluene. DNT may undergo photolysis in uppermost surface soil layers based on a rapid rate of photolysis observed in water. DNT is not expected to undergo hydrolysis in soil due to a lack of functional hydrolyzable functional groups (HSDB 2009).

Nitroglycerin undergoes rapid biodegradation using batch reactors and digestors but its rate of biodegradation in soil is unknown. Hydrolysis of nitroglycerin in soil may be important under alkaline conditions but is not expected to be an operable degradation process at the site due to the neutral pH of the soil (HSDB 2009).

5.1.4 Leaching of Chemicals from Soil to Groundwater

Chemicals in soil have the potential to migrate to greater depths with infiltrating water. As precipitation infiltrates, chemicals may be leached from the soil and carried to greater depths and potentially to groundwater. Table 5-3 summarizes the screening results for soil data including: constituents detected, minimum and maximum concentrations detected, number of detections, number of samples, and number of samples above risk-based soil to groundwater screening levels (SLs) and background (inorganics only) to evaluate the potential migration of chemicals in soil to groundwater. Risk-based SLs were obtained from the April 2009 Regional Screening table (USEPA 2009) and utilize a dilution attenuation factor (DAF) 10. A DAF 10 was used for the site due to the lack of an infinite source, the depth to groundwater, and the attenuation of chemicals due to soil types. The screening identified the following chemicals with detected concentrations above their generic DAF 10 SLs and background point estimates (inorganics only):

Chemical	# Detects/ # Samples	# Detects Above SL
Iron	32/32	2
Thallium	32/32	1
Trichloroethene	3/14	3
Benzo(a)anthracene	25/32	2
Benzo(a)pyrene	29/32	12
Benzo(b)fluoranthene	29/32	1
Naphthalene	10/32	4
2,4,6-Trinitrotoluene	5/32	5
2.6-Dinitrotoluene	1/32	1
Nitroglycerin	6/32	6

Factors affecting leaching are discussed below followed by assessments for soil to groundwater COPCs identified summarized above with concentrations above SLs. The degree to which a chemical is leached is strongly influenced by the chemical's tendency to partition to the solid or aqueous phases, which is largely a function of the chemical's solubility and particle affinity.

Water Solubility

Water solubility of a chemical is the mass of chemical that will dissolve in a unit volume of water at a specific temperature. Chemicals with a high solubility can often be readily dissolved in water and therefore are susceptible to being mobilized from the soil matrix with infiltrating water and migrating downward to groundwater. Chemicals with a low solubility tend to partition to soil.

The solubility of organic chemicals is typically a function of the hydrophobic nature of the chemical. Many organic chemicals are non-polar and therefore do not dissolve readily into water, which is a polar solution. The organic COPCs identified in soil at the site (PAHs and nitroglycerin) have low to moderate water solubility. Water solubility data for COPCs are summarized in Table 5-2.

Adsorption

The aqueous concentration of chemicals in soil systems can also be substantially influenced by adsorption reaction to the soil matrix. Adsorption is the ability of a substance to bind to the surface of soil particles from reactions that occur between the chemical and the soil particle surface. Organic compounds are frequently non-polar, and therefore, tend to interact with organic matter commonly associated with the soil matrix. The tendency for a chemical to be adsorbed to the organic fraction of soil (or sediment) can be measured by the chemical's organic carbon partition coefficient (K_{oc}). The lower the K_{oc} values the more leaching potential from soil to water as summarized below. Organic compounds with a K_{oc} less than 100 liters per kilogram (L/kg) have a high potential to leach from soil to water such as TCE. Progressively higher values of K_{oc} indicate lower leaching potential. Organic compounds with K_{oc} values

in the range of 1E+04 to 1E+06 L/kg, such as the high molecular weight PAHs, are generally immobile or nearly immobile in soil. Values of K_{oc} for COPCs are summarized in Table 5-2.

Site-specific distribution coefficients (K_d) can be estimated for each organic COPC, as the product of the K_{oc} of the chemical and the fraction of the organic carbon (f_{oc}) in the soil matrix. The distribution coefficient is a measure of the ratio of chemical mass that partitions to the solid and liquid phases under equilibrium conditions. The fraction of organic carbon measured in site soil ranged from 0.47 to 1.5% based on physical data collected at the site. Calculated K_d values are presented in Table 5-2. Based on solubility, K_{oc} and K_d values, the high molecular weight PAHs are expected to be immobile in soil while the nitroglycerin is expected to have low to moderate mobility.

5.1.4.1 Development of Site Specific Soil-to-Groundwater SLs

Site-specific soil-to-groundwater SLs have been calculated for organic chemicals to evaluate the potential for leaching of soil to groundwater COPCs to groundwater at concentrations of potential concern. EPA equation B-13 included in Appendix B of the Supplemental Guidance for Developing SSLs for Superfund Site (USEPA 2002) has been modified to incorporate the following site-specific parameter data for each disposal area as summarized in the following table.

$$C_t = C_w(K_{oc} * f_{oc} + \frac{\theta_a + \theta_w * H'}{\rho_b}) \qquad \text{Equation } 5-1$$

where:

Parameter	Definition (Units)	Value	Source
DAF	Dilution Attenuation Factor (unitless)	10	DAF Value
C_t	Screening level in soil, (mg/kg)	Calculated Using Equation 5-1	USEPA 2002c
C_w	Target leachate concentration (mg/L) x DAF	Chemical Specific T-RSL DAF (10)	USEPA April 2009 RSL Table
K_{oc}	Soil organic carbon-water partition coefficient (L/kg)	Chemical Specific	RAIS (2007)
f_{oc}	Organic carbon content of soil, (kg/kg)	0.01 (1%)	Average Concentration of TOC from Table 2-1
θ_w	Water-filled soil porosity, (L_{water}/L_{soil})	0.3	Default (USEPA 2002)
θ_a	Air-filled soil porosity, (L_{air}/L_{soil}), (η - θ_w)	0.09	Calculated based on Average of RFI Physical Soil Results
ρ_b	Dry soil bulk density	1.61 kg/L	Average of RFI Physical Soil Test Results (Table 2-1)
H’	Henry's law constant	Chemical-specific	RAIS (2007)

Notes: RAIS = Risk Assessment Information System – Chemical Specific Factors at http://rais.ornl.gov/

Detailed SL calculations are presented in Appendix C.7. The leaching potential of COPCs is evaluated in the following based on the chemical properties of the COPCs, comparisons of the site data to SLs, and an evaluation of groundwater data from the OBG (source of chemicals in the RFI Study Area).

5.1.4.2 Iron

Iron naturally occurs at appreciable levels in soil at RFAAP with a background point estimate of 50,962 mg/kg. Adsorption of iron to soil is dependent on pH and organic matter, with an increase in either of these parameters resulting in increased adsorption. Mobility is also influenced by oxidation reduction potential, with iron becoming more mobile under reducing conditions than oxidizing conditions (HSDB 2009). Soil pH values are in the range of 5 to 7 and will likely reduce the mobility of iron along with the presence of appreciable organic matter in surface and near surface soil (3.5%). Site data indicate that iron concentrations detected above the SL and background point estimate are limited to surface or near surface intervals in 2 of 32 samples collected from the RFI study area. In addition as presented in Section 6.4.2, background statistical evaluations identified iron as consistently below background. Based on the background evaluation, near neutral pH of site soil, and appreciable organic matter in surface and near surface soil, iron is not considered a potential concern for the soil-to-groundwater pathway in the RFI study area.

5.1.4.3 Lead

Although lead does not have a risk-based soil to groundwater SL (USEPA 2009), due to the nature of the RFI study area the migration of lead from soil to groundwater was assessed utilizing the SESOIL model (Appendix C.7). The SESOIL unsaturated zone fate-and-transport model was used to evaluate the mobility of lead in soil within the RFI study area (Environmental Software Consultants, Inc., 2008). SESOIL is a one-dimensional vertical fate-and-transport screening level model for the unsaturated zone. It simulates chemical fate-and-transport based on diffusion, adsorption, volatilization, biodegradation, and hydrolysis. The model is designed to simultaneously model both chemical and soil water transport in the soil column under natural seasonal climatic variations.

Lead mass loading parameters for this assessment assumed a lead concentration equal to the mean concentration detected in site soil (414 milligram per kilogram) across the entire 1.6 study area for a depth interval of 0 to 5.5 ft. Local climate data for Radford, Virginia and site-specific physical soil data were also incorporated into the assessment.

The results of the SESOIL assessment indicated that over the 30-year period modeled, lead is immobile in site soil, with 99.87 percent of the lead mass remaining adsorbed to soil, with the remaining mass present in the soil air phase. Over the 30-year modeled period, the net change in lead depth in the soil column is 1.2 centimeters or less than 0.5 inches. It is therefore concluded from the assessment that substantial vertical migration of lead in soil is unlikely within the evaluated study area.

As the model demonstrates, most lead is retained strongly in soil and very little leaches to groundwater. Lead has not been identified as a COPC for the soil-to-groundwater migration pathway at the OBG adjacent to the RFI study area and lead was not detected in groundwater samples collected from the OBG in 2008 (Draper Aden 2009a in Appendix G). Based on the results of the SESOIL model, the immobile nature of lead in soil and lack of groundwater detections at the OBG (the source area for the chemicals at the RFI study area), lead is not considered a potential concern for the soil-to-groundwater pathway in the RFI study area.

5.1.4.4 Thallium

Thallium commonly occurs as salts in soils but can be immobilized by clays and retained in soil by aluminum, and iron oxides, and organic matter, which are present at appreciable levels in site soil (HSDB 2009). Site data indicate the thallium concentration detected above the SL and background point estimate is limited to the surface interval in 1 of 32 samples collected from the RFI study area. Thallium has not been identified as a COPC for the soil-to-groundwater migration pathway at the OBG adjacent to the RFI study area and thallium was not detected in groundwater samples collected from the OBG in 2008 (Draper Aden 2009a in Appendix G). In addition as presented in Section 6.4.2, background statistical

evaluations identified thallium as consistently below background. Based on the above information, thallium is not considered a potential concern for the soil-to-groundwater pathway in the RFI study area.

5.1.4.5 VOCs - TCE

TCE was identified as a COPC for the soil-to-groundwater migration pathway. This compound has a high solubility, lower K_{oc} values, and moderate mobility in subsurface (Table 5-2). As presented in the table below, the detected concentrations of TCE in soil above site-specific SLs (Appendix C.7) was limited to two samples above the site-specific SL and the mean soil concentration was below the site-specific SL.

	Detected Concentrations (mg/kg)				
COPC	MDC	Mean	Site-Specific SL	MDC Above SL	Mean Above SL
Trichloroethene	0.057	0.0073	0.015	Yes (2)	No

Based on the limited detections above site-specific SL, the low levels of these detections, and the mean concentrations below the site-specific SL, TCE is not considered a potential concern for the soil-to-groundwater pathway in the RFI study area.

5.1.4.6 PAHs

Several high molecular weight PAH compounds were identified as COPCs for the soil-to-groundwater migration pathway at the RFI study area. As presented in the table below, the detected concentration of PAHs in soil above site-specific SLs (Appendix C.7) was limited to one sample slightly above the site-specific SL for benzo(a)pyrene and the mean soil concentration was below the site-specific SL.

	Detected Concentrations (mg/kg)				
COPC	MDC	Mean	Site-Specific SL	MDC Above SL	Mean Above SL
Benzo(a)anthracene	0.480	0.056	0.67	No	No
Benzo(a)pyrene	0.290	0.047	0.23	Yes (1)	No
Benzo(b)fluoranthene	0.630	0.086	2.3	No	No
Naphthalene	0.022	0.0032	0.026	No	No

High molecular weight PAHs identified as COPCs tend to be immobile in soil due to negligible solubility and high K_{oc} values. High molecular weight PAHs have not been identified as COPCs for the soil-to-groundwater migration pathway at the OBG adjacent to the RFI study area and these PAHs have not been detected in groundwater samples collected from the OBG in 2008 (Draper Aden 2009a in Appendix G). Based on the limited detection above site-specific SLs, the immobile nature of the high molecular weight PAHs in soil, and lack of groundwater detections at the OBG, PAHs are not considered a potential concern for the soil-to-groundwater pathway in the RFI study area.

5.1.4.7 Explosives - 2,4,6-TNT, 2,6-DNT, and Nitroglycerin

Explosives detected as COPCs in soil have moderate solubility in water. The K_{oc} values for the explosives range from medium low for nitroglycerin, to moderate for 2,6-DNT, and to moderately high for 2,4,6-TNT. Based on their solubility and K_{oc} values, explosives are expected to have some mobility in soil and potential to leach to groundwater if present at sufficiently high concentrations. As presented in the table below, 2,4,6-TNT and nitroglycerin had detected concentrations in one or more samples above

their site-specific SLs (Appendix C.7) and the mean soil concentration of 2,3,6-TNT was below its site-specific SL.

COPC	Detected Concentrations (mg/kg)			MDC Above SL	Mean Above SL
	MDC	Mean	Site-Specific SL		
2,4,6-Trinitrotoluene	3	0.23	0.408	Yes (3)	No
2.6-Dinitrotoluene	0.39	N/A	1.5	No	No
Nitroglycerin	21	1.06	0.056	Yes (6)	Yes

Although low levels of explosives have been detected at concentrations above site-specific SLs, based on the limited number of samples above SLs, the mean concentrations being below the site-specific SL with the exception of nitroglycerin, and the lack of explosives detections in groundwater at the OBG (the source area for chemicals in the RFI study area), explosives are not considered a potential concern for the soil-to-groundwater pathway in the RFI study area.

5.2 FATE AND TRANSPORT SUMMARY

Volatilization was not identified as an important fate and transport process in the RFI study area given the identification of one volatile COPC (TCE) in soil for the soil to groundwater migration pathway only. Degradation processes are not expected to be a significant fate and transport process in soil given that lead is the primary COPC. Erosion processes and mass transport of surface soil are expected to be impeded by the presence of thick vegetative cover across the RFI study area. A quantitative evaluation of soil erosion in the RFI study area indicated that minimal mass of lead would be potentially transported to the river by erosion processes and the potential soil loss is not considered a significant future risk to the New River (Section 4.4). Leaching from soil is not expected to be a significant fate and transport process given that lead is strongly adsorbed to soil. The latest groundwater data (2008) from monitoring wells located adjacent to the perimeter berm separating the OBG from the RFI study area did not indicate leaching of detectable levels of lead or other site soil COPCs to groundwater.

Table 5-1a
Chemical Properties Affecting Fate and Transport
Study Area at SWMU 13 RFI Report
Radford Army Ammunition Plant, Radford, VIrginia

Property	Description
Specific Gravity	Specific gravity is the ratio of the density of a chemical to the density of water and its tendency to float (specific gravity <1) or sink (specific gravity >1) in water. Chemicals that are immiscible in water can exist as non-aqueous phase liquids and are referred to as light non-aqueous phase liquid if their specific gravity is less than one, or dense non-aqueous phase liquid if their specific gravity is greater than one.
Water Solubility	Water solubility of a chemical is the mass of chemical that will dissolve in a unit volume of water at a specific temperature. Chemicals with a high solubility tend to remain dissolved in water rather than partition to soil or sediment are less likely to volatilize, and more likely to biodegrade. Chemicals with a low solubility tend to partition to soil or sediment, are more likely to volatilize and less likely to biodegrade.
Vapor Pressure	Vapor pressure of a chemical is how readily it will volatilize to the atmosphere. Volatilization from water is dependent upon vapor pressure and Henry's law constant. Vapor pressures in their pure state range from 0.001 to 760 millimeters mercury (mm Hg) for liquids to less than 1E-10 mm Hg for solids.
Henry's Law Constant	Henry's law constant of a chemical is a measure of how a chemical will partition between air and water at equilibrium. It is the ratio of the vapor pressure to the water solubility (atm-m^3/mole) and can be used to calculate the rate of volatilization of a chemical from water. Chemicals with a high Henry's law constant more readily volatilize from water.
Organic Carbon Partition Coefficient (K_{oc})	K_{oc} is a measure of the tendency for a chemical to be sorbed to the organic fraction of soil and sediment. The lower the K_{oc} values the more leaching potential from soil or sediment to water. Chemicals with a K_{oc} less than 100 milliliters per gram (mL/g) have a high potential to leach from soil or sediment to water, while K_{oc} values in the range of 100 to 500 mL/g indicate a moderate leaching potential.
Octanol-Water Partition Coefficient (Ko_w)	K_{ow} describes the partitioning of an organic chemical between a polar phase (water) and a relatively nonpolar phase (1-octanol). It is equated to the partitioning (sorption) in an aquifer of a chemical between the water and the porous media organic content. A chemical with a high K_{ow} is hydrophobic and may be relatively immobile in an aqueous system but may be mobilized in the presence of an organic solvent.

Table 5-1b
Fate Processes Affecting Metals
Study Area at SWMU 13 RFI Report
Radford Army Ammunition Plant, Radford, Virginia

Process	Description
Ion Exchange	Ion exchange is a specific category of adsorption due to an affinity of the solid surface for the chemical. Ion exchange occurs when the adsorbent charge deficiency can be neutralized more efficiently by ions in solution than by those ions currently adsorbed. As an example, if sodium ions (monovalent) have accumulated at the interface and suddently calcium ions (divalent) appear, the surface excess can be more efficiently neutralized by the calcium ions than by the sodium ions; thus, the sodium ions will desorb and the calcium ions will adsorb and an exchange of ions will occur. Clay minerals are frequently the dominant source of ion exchange in the subsurface. The surface charge of clays and many other mineral surfaces is a function of pH. At low pH (excess hydrogen ions), the surface can exhibit a positive net charge while at higher pH (excess hydroxyl ions) the surface can exhibit a negative charge (Knox et al 1993). The surface area of the exchange site significantly influences the level of adsorption; this parameter is typically discussed in terms of the cation exchange capacity (CEC) of the medium and is expressed in units of milliequivalents of exchanging cations per 100 grams of solids (meq/100 g). CEC values indicate the likely type of clay present; the higher the CEC value the greater the absorption potential.
Chemical Speciation	Most metals occur in more than one ionic form (species) in solid and aqueous media. These species form from hydrolysis, oxidation reduction reactions, and complexation reactions, which may have different valences and mobilities in soil water, groundwater, and surface water due to different affinities for adsorption and different solubilty controls. Simple ionic specifies frequently combine ligands to form ionic or neutral-charge aqueous complexes. Environmental conditions that affect speciation of metals include pH, redox potential, and organic ligands.
Oxidation Reduction Potential (ORP)	Redox refers to the transfer of electrons and resultant specifies change of ions or compounds. Oxidation is the loss of electrons and reduction is the gain of electrons. Redox can cause changes in the mobility of many metals, such as site COPCs iron, manganese, and arsenic. The ability of a redox reaction to occur is a function of the redox potential. Redox potential is typically defined in terms of the negative logarithm of the free-electron activity (pE). The redox potential can also be expressed in terms of volts (Eh). Low values of pE indicate high electron activity and favor electron-rich species (reduced). High values of pE indicate low electron activity and favor electron-poor species (oxidized) (Knox et al 1993).

Table 5-1c
Fate Processes Affecting Organics
Study Area at SWMU 13 RFI Report
Radford Army Ammunition Plant, Radford, Virginia

Process	Description
Sorption	Sorption includes the processes of adsorption and absorption. Adsorption is a mass transfer process where a substance is transferred from a phase to the surface of a medium (e.g. soil or sediment) where it is bounded by chemical or physical forces. Absorption is the partitioning between two phases (Knox et al. 1993). Sorption reactions are either sorbent or solvent-motivated. Sorbent-motived reactions occur when there is an attraction between the sorbent and the solute and the chemical accumulates at the surface due to the affinity of the surface for the chemical. Solvent-motivated reactions occur when the chemical is hydrophobic, such as nonionic organics, where the chemical will accumulate at an interface or partition into a nonionic phase (associate with the organic content of the medium). For nonionic organics, the fraction of organic content (foc) of the subsurface material is the dominant soil characteristic affecting sorption (Knox et al. 1993). Primary indicators of the partitioning of a chemical are the organic carbon water partition coefficient (Koc), soil/water distribution coefficient (Kd), the octanol water partitioning coeffient (Kow), and the calculated retardation factor.
Hydrolosis	Hydrolysis is the degradation process via chemical reactions (oxidation, reduction, hydrolysis) without the participation of organisms. Hydrolysis is a chemical decomposition process that uses water to split chemical bonds of substances. There are two types of hydrolysis, acid and enzymatic. Hydrolysis is limited to chemical that contain hydrolyzable groups and is effected by the contaminants hydrolysis half life.
Volatilization	Volatilization is the process by which a contaminant changes from a liquid phase to a gas phase. This process applies to organic comtaminants migrating from the soil or surface water. Volatile organic chemicals are a class of chemicals that easily evaporate or mix with the atmosphere. The potential volatilization of a chemical is affected by the compounds vapor pressure, solubility, organic carbon partitioning coefficient, and the temperature.
Abiotic Degradation	Abiotic degradation includes degradation processes in which organisms do not participate. Photolysis describes the abiotic degradation process via photochemical reactions such as photooxidation, photomineralisation without the participation of organisms. As described above, hydrolysis is an additional process of abiotic degradation.
Biotic Degradation	Biotic degradations the process in which chemical degradation of a contaminant is aided by soil organisms. Biotic degradation can be either aerobic or anaerobic. The rate of metabolism/cometabolism is affected by the contaminant's biochemical oxygen demand, chemical oxygen demand, degree of halogenation, etc. Reactions include but are not limited to oxidation/reduction and hydrolysis, as described above.

6.0 HUMAN HEALTH RISK ASSESSMENT

This human health risk assessment (HHRA) evaluates the probability and magnitude of potential adverse effects on human health associated with exposure to site-related chemicals in soil and groundwater. Refer to Section 2.0 for additional information regarding the site background. The HHRA was conducted for the site consistent with guidance included in USEPA's *Interim Final Risk Assessment Guidance for Superfund* (RAGS), as well as other USEPA guidance (USEPA 1989a,b; 1991; 1997a; 2001; 2002c; and 2004). Guidance documents are also noted on the RAGS Part D tables provided in Appendix E.1.

This HHRA consists of the following six sections:

- **Section 6.1: Data Summary and Selection of COPCs:** Relevant site data are gathered, examined, and discussed. Basic constituent statistics and screening levels are summarized. COPCs are identified by comparison to screening criteria as discussed in Section 6.1.2;
- **Section 6.2: Exposure Assessment:** Potentially exposed populations (e.g., receptors) and exposure routes are identified, and exposure point concentrations (EPCs) are calculated for COPCs. Standard exposure factors and health-protective assumptions are used to assess the magnitude, frequency, and duration of exposure for each exposure route and intakes are calculated;
- **Section 6.3: Toxicity Assessment:** Toxicity criteria for COPCs are gathered and presented;
- **Section 6.4: Risk Characterization:** Quantitative risks and hazards are estimated and summarized by combining toxicity criteria with intakes for each exposure route;
- **Section 6.5: Summary and Conclusions:** The results of the HHRA are summarized; and
- **Section 6.6: Uncertainties Analysis:** Uncertainties, "including uncertainties in the physical setting definition for the site, in the models used, in the exposure parameters, and in the toxicity assessment" (USEPA 1989) are discussed; and

As previously stated, the tabulated risk assessment results are presented in accordance with USEPA guidance described in RAGS: Volume I - Human Health Evaluation Manual (Part D, Standardized Planning, Reporting, and Review of Superfund Risk Assessments) (USEPA 2001). RAGS D requires the risk assessment results to be presented in a series of standardized tables, which are presented in Appendix E.1.

6.1 DATA SUMMARY AND SELECTION OF COPCS

6.1.1 Data Summary

Table 6-1 identifies the samples used in the COPC screening for soil. Refer to Section 4.0 for complete data tables for detected analytes for each media. Additional information regarding the data used in the HHRA is summarized below:

- Though several dioxins are known to be toxic, toxicity criteria are limited; therefore, the HHRA uses the method outlined in Interim Procedures for Estimating Risks Associated with Exposures to Mixtures of Chlorinated Dibenzo-p-dioxins and Dibenzofurans (CDDs and CDFs) (USEPA 1989a and WHO 2005) to assess risks due to exposure to dioxins and/or furans. Each congener is assigned a TEF, which corresponds to its toxicity relative to 2,3,7,8-TCDD. Each congener detection is multiplied by its corresponding TEF; the adjusted concentrations are then summed to derive one total 2,3,7,8-TCDD equivalent concentration for each sample. This concentration is then compared with toxicity criteria for 2,3,7,8-TCDD to calculate risks. TEFs are presented and total 2,3,7,8-TCDD equivalents are calculated for the site in Table 6-2.

- Flagged data such as J-flagged data (estimated concentration) and B-flagged data (detected in an associated blank) are considered detections and are used without modification;
- Rejected results (R-flagged) are not used;
- Data from duplicate sample pairs are averaged and treated as one result. If an analyte is detected in one of the sample pair, one half the detection limit of the non-detect is averaged with the detected result and the result is considered detected; and
- Chemicals that were not detected in at least one sample were considered as uncertain analytes in the evaluation of risk. Other qualified analytical data were retained in the assessment.

Additional information regarding specific soil and groundwater samples used in the HHRA is provided in Sections 6.1.1.1 and 6.1.1.2.

6.1.1.1 Surface Soil and Total Soil

As presented in Table 6-1, soil samples collected during SSP sampling events completed in 2003 and RFI sampling events completed in 2008 were used for the COPC screenings. In addition as presented in Table 6-1, the soil samples for the site have been divided into surface soil (0 to 1 ft bgs) and subsurface soil (1 to 15 ft bgs). The two soil data groupings used for COPC screening and the HHRA are surface soil (0 to 1 ft bgs) and total soil (0 to 15 ft bgs). The total soil data grouping consists of combining surface and subsurface soil to address mixing of potential constituents in soil during construction or land development activities. A total of 92 surface soil samples and 91 subsurface soil samples were used in the HHRA. Refer to Figures 3-1a and 3-1b for boring and associated soil sample locations.

The one dioxin/furan sample used in the COPC screening was the sample collected during the SSP investigation. The additional four dioxin/furan samples were collected as part of the Subpart X permit for the open burning ground and are screened in Table 2-4 of the RFI. The concentrations were below the applicable screening levels; therefore, would not result in the inclusion of dioxin/furans as a COPC. Given that the detected concentrations for dioxin/furans for a total of five samples were below applicable screening levels, no additional sampling for dioxin/furans is necessary.

6.1.1.2 Groundwater

As presented in Section 2.2.3, groundwater in the area of OBG is currently being evaluated under the facility's Subpart X permit issued by the VDEQ in October 2005. Groundwater monitoring and any required corrective action for groundwater will be addressed under the facility's Subpart X permit; therefore, groundwater will not be further investigated or addressed under this RFI. Therefore, groundwater samples were not collected as part of the RFI.

6.1.2 Identification of COPCs

COPCs were identified for the site by comparing the MDC to the following screening levels for each media: R-RSLs and I-RSLs for soil as presented in the October 2008 Regional SL Table (USEPA 2008). The lowest screening criterion for each medium was used to identify the COPCs. In accordance with USEPA Region III guidance, RSLs for non-carcinogenic chemicals were adjusted downward to a HQ of 0.1 to ensure that chemicals with additive effects were not prematurely eliminated during screening.

For nutrients detected in soil (calcium, potassium, magnesium, and sodium) that have no available RSL, the MDC was compared to the recommended daily allowance (RDA)-derived soil ingestion screening criteria. RDAs used to calculate the RDA-derived ingestion screening criteria were obtained from Recommended Dietary Allowances, 10th edition ©1989 by the National Academy of Sciences (National Academy Press, Washington, D.C.). Table 6-3 presents the equation, exposure parameters, and RDAs used, as well as the calculated screening criteria for the adult resident and child resident receptors. The lowest screening criterion for each nutrient (e.g., the screening criteria for the child resident) was selected as the screening criterion.

Analytes detected at a maximum concentration greater than the corresponding adjusted RSLs or screening values identified above (or those for which no screening criteria exists) were selected as COPCs. COPC screening tables the site are presented in Appendix E.1, Tables E.1-2.1 (COPC Determination - Surface Soil), E.1-2.2 (COPC Determination - Total Soil), and E.1-2.3 (Non-Detect Screening – Soil). A summary of the results of the human health COPC screenings for the site are presented in the table below.

Human Health COPCs Identified

Chemical	Surface Soil	Total Soil
Aluminum	X	X
Antimony		X
Arsenic	X	X
Cobalt	X	X
Iron	X	X
Lead	X	X
Manganese	X	X
Thallium	X	X
Vanadium	X	X
Benzo(a)anthracene	X	X
Benzo(a)pyrene	X	X
Benzo(b)fluoranthene	X	X
Carbazole*	X	X
Dibenz(a,h)anthracene	X	X
Dibenzofuran*	X	X
Dimethylphthalate*	X	X
Nitroglycerin	X	X

Note: * denotes COPC identified due to no screening value available

6.2 EXPOSURE ASSESSMENT

The objective of the exposure assessment is to estimate "the type and magnitude of exposures to chemicals of potential concern" (USEPA 1989b). When combined with chemical-specific toxicity information (summarized in the toxicity assessment), these exposures produce estimations of potential cancer risks and non-cancer hazards.

6.2.1 Conceptual Site Model/Receptor Characterization

A refined conceptual site model (CSM) for the RFI study area is presented on Figure 6-1. The site is an approximate 40 to 60 ft wide area between the operational area of OBG and the New River within the 100 year floodplain. This area is outside of the RFAAP perimeter security fence and slopes moderately to steeply from the outside of the OBG perimeter berm down to the river, with a vertical elevation difference of approximately 10 ft. Thick grass and stands of trees cover the RFI study area. Subsurface geology consists of fill material and alluvial deposits overlying carbonate bedrock of the Elbrook Formation. Groundwater is present within the lower portion of the alluvial deposits and in underlying bedrock. Groundwater flows south from OBG toward the RFI study area and the New River.

Potentially affected media include surface soil, subsurface soil, groundwater, and sediment of the New River. Runoff controls within the OBG prevent storm water runoff or drainage from the active burning ground from entering the RFI study area. Within the RFI study area, depending on the amount of precipitation, stormwater will either infiltrate into soil due to thick vegetative cover or flow downslope toward the New River. As presented in Section 4.4, this potential migration pathway is impeded by the presence of significant vegetation in the RFI study area.

Potential source areas at the RFI study area consist of soil due to potential releases to soil associated with historical operations at the adjacent OBG prior to modification of the OBG operations to prevent potential releases to the RFI study area. Other constituent sources have not been identified in the RFI study area.

Historical operations at the burning ground may have resulted potential releases to soil in the RFI study area due to runoff from the adjacent burning areas and deposition of particulate matter from burning operations. Chemicals released to surface soil at the site may be transported by stormwater runoff and overland flow to the RFI study area or to the New River located adjacent to the site. Leaching of chemicals to subsurface soil and groundwater is another potential release mechanism. Potential releases to the New River (surface water and sediment) could also occur from any discharging groundwater containing dissolved phase constituents associated with the OBG. Groundwater in the area of OBG is currently being evaluated under the facility's Subpart X permit issued by the Virginia Department of Environmental Quality (VDEQ) in October 2005 which includes semi-annual compliance groundwater monitoring; therefore, groundwater will not be further investigated or addressed under this RFI. Although historic activities at the burning ground may have impacted the New River via stormwater runoff and discharging of groundwater, this RFI focuses on the existing soil conditions within the RFI study area and evaluates potential migration pathways to the New River via stormwater runoff from the RFI study area. As presented in Section 4.4, based on the limited extent of chemicals in soil within the study area above RSLs, the low lying, lush vegetation present at the site (see photo log in Appendix A), and the percentage of ground cover (90%), the potential for RFI study area related releases from soil to the New River via runoff at levels of concern is not considered significant. Potential release mechanisms and affected media quantitatively assessed as part of this RFI are shown on the conceptual site diagram presented on Figure 6-2.

Lead concentrations in New River sediment are below the human health residential SL of 400 mg/kg, with the exception of station NR-SED-16 (500 mg/kg) located downstream of the OBG, SWMU 54, and the RFAAP MMA. The mean concentration of lead for each sub-segment sampled and the entire reach sampled was below 400 mg/kg.

The SWMU 54 RFI/CMS Report (URS 2008b) concluded that attributing lead and other metals detected in sediment samples to a specific source or sources is not possible for the RFI given the complex transient flow and depositional patterns in the river, and therefore, it is recommended that these data be used holistically as part of any overall evaluations of the facility and potential receptors conducted for the RCRA Corrective Action Permit.

During the SWMU 54 RFI/CMS investigation, it was established that lead tends to partition to sediment rather than remain in surface water: therefore, the risk to human health receptors is considered minimal with regard to exposure to lead in surface water.

6.2.2 Identification of Exposure Pathways

Although current and likely future land-use scenarios are limited to industrial operations, both residential and industrial scenarios were evaluated. Potential receptors that were evaluated include current/future maintenance workers, current/future trespasser (due to site's location outside of the Installation perimeter fence), future construction workers, future commercial workers, future adult residents, and future child residents. Carcinogenic risk was assessed for the hypothetical lifetime resident to account for cumulative lifetime risk. The exposure duration for the lifetime resident scenario was assumed to be 30 years total; therefore, for carcinogens, exposures are combined for hypothetical child resident (6 years) and adult resident (24 years). Potentially complete pathways for each receptor and pathways to be assessed are summarized on Figure 6-2, Conceptual Site Diagram.

In Appendix E.1, Table E.1-1 summarizes the selection of exposure pathways for the SWMU and receptor listing the rationale for the inclusion or exclusion of each pathway. A conceptual site diagram presenting the sources, release mechanisms, pathways, and receptors for the site are presented on Figure

6-2. The table below summarizes the exposure pathways and media evaluated for each of the potential receptor populations.

Media/Exposure Pathways	Exposure Scenarios				
	Current/Future		Future		
	Maintenance Worker	Adolescent Trespasser	Commercial Worker	Construction Worker	Resident [1]
Surface Soil					
Ingestion	X	X			X
Dermal Absorption	X	X			X
Inhalation of Fugitive Dust	X	X			X
Inhalation of Outdoor Vapors [2]					
Total Soil [3]					
Ingestion	X	X	X	X	X
Dermal Absorption	X	X	X	X	X
Inhalation of Fugitive Dust	X	X	X	X	X
Media/Exposure Pathways	**Current/Future**		**Future**		
	Maintenance Worker	**Adolescent Trespasser**	**Commercial Worker**	**Construction Worker**	**Resident [1]**
Inhalation of Outdoor Vapors [2]					
Inhalation of Indoor Vapors [2]					

X = Quantitative Evaluation

[1] The exposure duration for the lifetime resident scenario is assumed to be 30 years total; therefore, for carcinogens, exposures are combined for hypothetical child resident (6 years) and adult resident (24 years).

[2] VOCs not identified as COPC for soil for SSP; therefore, not tested for in RFI.

[3] The evaluation of total soil assumes that construction, excavation, or other activities "mix" the surface and subsurface soil, thus changing the constituent concentrations available on the surface.

6.2.2.1 Current/Future Land Use Scenario

Two receptors, the maintenance worker and the adolescent trespasser, were identified under the current land use scenario. The receptors are assumed to contact surface soil. It is assumed that the maintenance worker scenario and adolescent trespasser scenario are likely to exist in the future; therefore, exposure to total soil is possible if excavation activities resulting in the mixing of surface soil and subsurface soil occur in the future.

6.2.2.2 Future Land Use Scenario Only

In the event that construction occurs at the site, soil that was previously found at depth may be brought to the surface and become available to receptors. Therefore, the future hypothetical industrial use scenarios of the construction worker and commercial worker are assumed to come into contact with total soil at the site. Although the site is assumed to remain industrial in nature, the residential scenario is evaluated in this HHRA to meet clean closure requirements under RCRA. Future hypothetical resident is assumed to come into contact with surface soil and/or total soil.

6.2.3 Calculation of EPCs

To calculate intakes, the mean concentration of each COPC is estimated and is referred to as the EPC. To account for uncertainty when estimating EPCs from sample data, the 95% upper confidence limit of the mean (95% UCL) is used instead of the mean itself (USEPA 1989b). Methods used to calculate 95% UCLs are based on guidance provided in the following documents *Calculating Upper Confidence Limits for Exposure Point Concentrations at Hazardous Waste Sites* (USEPA 2002b) and *On the Computation of*

a 95% Upper Confidence Limit of the Unknown Population Mean Based Upon Data Sets with Below Detection Limit Observations (USEPA 2006a).

In general, the method used to calculate a 95% UCL depends on: 1) the number of samples, 2) the prevalence of non-detects, and 3) the data distribution (e.g., normal or lognormal). Non-detects introduce uncertainty in the data set because the true concentration may be between zero to just below the detection limit. Therefore, distributional assumptions are difficult to make for COPCs with a high rate of non-detects. ProUCL 4.0 (USEPA 2007c) is used to calculate EPCs for the site with the exception of data sets with a low frequency of detection for which the MDC was used in the risk assessment. EPCs for soil COPCs are presented in Tables E.1-3.1 and E.1-3.2 of Appendix E.1. EPC calculations for the site are included in Appendix D.1.

To address the inhalation of fugitive dust from soil exposure pathway, particulate emission factors (PEFs) were used to derive ambient air EPCs for soil COPCs. The PEFs used to calculate inhalation daily intakes were calculated in accordance with the *Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites* (USEPA 2002c), as provided in Appendix E.1, Table E.1-4.3. VOCs were not identified as COPCs in soil; therefore, the inhalation pathway for vapors from soil was not evaluated for the site.

6.2.4 Quantification of Exposure: Calculation of Daily Intakes

For each receptor and pathway with the exception of inhalation, chronic daily intake (CDI, expressed as milligrams of COPC per kilogram body weight per day) for each COPC is estimated by combining the EPC with exposure parameters such as ingestion rate, frequency of contact, duration, and frequency of exposure. For the inhalation pathway an exposure concentration, expressed as milligrams of COPC per meter cubed of air, is estimated by combining the EPC with exposure parameters such as PEFs, volatilization factors, frequency of exposure, exposure time, and exposure duration (USEPA 2009). In addition, intake parameters are selected so the combination of intake variables results in an estimate of the reasonable maximum exposure for that pathway (USEPA 1989b).

Intake formulas, exposure parameters, and chemical-specific parameters are provided in Appendix E.1, Tables E.1-4.1a through E.1-4.1d. The results of the intake and exposure concentration calculations are presented for each receptor in Appendix E.1, Tables E.1-7.1 through E.1-7.12.

6.3 TOXICITY ASSESSMENT

The methodology used for classifying health effects from exposure to chemicals is recommended by USEPA and considers chronic exposures. The chronic toxicity criteria were obtained from the September 2008 USEPA Regional Screening Table which utilizes the following hierarchy:

- Tier 1 – USEPA's Integrated Risk Information System (IRIS);
- Tier 2 – Provisional Peer-Reviewed Toxicity Values (PPRTVs), as developed on a chemical-specific basis by the Office of Research and Development/National Center for Environmental Assessment/Superfund Health Risk Technical Support Center; and
- Tier 3 – Other sources of toxicological reference values that include those from Cal EPA, Minimal Risk Levels (MRLs) from the Agency for Toxic Substances and Disease Registry (ATSDR), and finally the Human Health Effects Assessment Summary Table (HEAST) toxicity values.

Toxicity criteria used to quantify non-carcinogenic hazards (reference doses (RfDs) and reference concentrations (RfCs)) and carcinogenic risks (cancer slope factors (CSFs) and unit risks) are presented in Appendix E.1, Tables E.1-5.1, E.1-5.2, E.1-6.1, and E.1-6-2.

6.3.1 Health Effects Classification and Criteria Development

According to USEPA's science policy, there are two primary approaches to developing toxicity values or health effects criteria. The non-threshold approach is based on USEPA's scientific policy position that a small number of molecular events can evoke changes in a single cell or a small number of cells. This is described as a non-threshold initiator mechanism because there is essentially no level of exposure (i.e., a threshold) to a constituent that will not result in some finite possibility of causing an adverse effect. Another assumption stemming from USEPA's science policy is that the dose-response curve is linear at low doses. For most carcinogens, toxicity criteria are based on the non-threshold approach.

The threshold approach is based on the assumption that organisms have repair and detoxification capabilities that must be exceeded by some critical concentration (threshold) before the adverse effect is manifested. For example, an organ can have a large number of cells performing the same or similar functions that must be significantly depleted before the effect on the organ is realized. This threshold view holds that a range of exposures from just above zero to some finite value can be tolerated by the organism without an appreciable risk of adverse effects. Toxicity criteria for non-carcinogens are based on the threshold approach. Furthermore, as additional information regarding the mechanisms of toxicity becomes available, the threshold approach may also apply to some carcinogens (*e.g.*, chloroform).

6.3.1.1 Cancer Slope Factors

For carcinogens, USEPA estimates the excess lifetime cancer risks associated with various levels of exposure by developing CSFs and unit risks. CSFs are expressed in terms of reciprocal dose, as units of: $(\text{mg chemical/kg body weight - day})^{-1}$, and describe the upper-bound increase in an individual's risk of developing cancer over a 70-year lifetime per unit of exposure. Unit risks, used to assess the inhalation pathway, are expressed either as a reciprocal air concentration, in units of micrograms per meter cubed $(\mu g/m^3)^{-1}$. Similarly, they are defined as the probability of an individual developing cancer over a 70-year lifetime from exposure to one unit of concentration in air or water. Because regulatory efforts are geared to be protective of public health, including even the most sensitive members of the population, the CSFs and unit risks are derived using conservative assumptions.

CSFs and unit risks are derived from the results of human epidemiological studies or chronic animal bioassays. Animal studies usually must be conducted using relatively high doses to detect possible adverse effects. Because humans are expected to be exposed to doses lower than doses used in the animal studies, the potential cancer risks at lower doses are estimated by using mathematical models. The data from animal studies are typically fitted to the linearized multistage model to obtain a dose-response relationship. In general, after the data are fit to the dose-response model, the 95% UCL of the slope of the resulting dose-response relationship at low doses is calculated. This upper-bound limit is subjected to various adjustments and an interspecies scaling factor is applied to derive the slope factor or unit risk for humans. Thus, the actual risks associated with a given intake of a potential carcinogen quantitatively evaluated based on animal data are generally regarded as not likely to be above the risks estimated using these CSFs or unit risks and they may be as low as zero (USEPA 1986b). Dose-response data derived from human epidemiological studies are fitted to dose-time-response curves. These models provide rough, but plausible, estimates of the upper limits on lifetime risk. CSFs and unit risks based on human epidemiological data are derived using conservative assumptions and are unlikely to underestimate risks for a given level of exposure.

Weight-of-evidence categories represent an assessment of the amount and quality of the data, which support the finding that specific chemicals and elements can cause cancer in humans. Although USEPA's guideline for carcinogen risk assessment (USEPA 1996) proposes a weight-of-evidence narrative, IRIS currently uses the original alphanumeric classification. Under the existing guidelines (USEPA 1986a), chemicals are classified as either Group A, Group B1, Group B2, Group C, Group D, or Group E. Group A includes those substances for which high-quality studies have demonstrated a relationship between the exposure to the substance in question and the development of cancer in human populations. Groups B1, B2, and C represent chemicals with limited (B1) or insufficient (B2) human evidence of carcinogenicity,

and sufficient (B1, B2) or insufficient (C) animal data. Group D substances are those for which there is insufficient evidence or not evidence of carcinogenicity in humans or animals and Group E substances are those not having evidence of carcinogenicity available in adequate human or animal studies.

6.3.1.2 Reference Doses and Reference Concentrations

Toxicity criteria for non-carcinogens are generally developed using verified risk reference doses (RfDs) and reference concentrations (RfCs). These are developed by USEPA and listed in IRIS or can be obtained from HEAST (USEPA 1997c) and supplements. RfDs are expressed in units of dose (mg chemical/kg body weight-day) and are usually derived either from human studies involving workplace exposures or from animal studies. RfCs, used to assess the inhalation pathway, are expressed as air concentrations (mg/m^3). In addition, RfDs are estimates (with uncertainty spanning perhaps an order of magnitude) of the daily exposure to the human population (including sensitive subpopulations) that is likely to be without an appreciable risk of deleterious effects during a lifetime. The RfD is used as a reference point for gauging the potential effects of exposures. Usually, exposures (as chemical intakes or doses) that are less than the RfD are not likely to be associated with adverse health effects.

RfDs are developed for both chronic and sub-chronic exposures. Chronic RfDs are presented in IRIS or HEAST and are intended for use in evaluating exposures of durations greater than seven years. Sub-chronic RfDs are developed by USEPA's National Center for Environmental Assessment (NCEA) and are used to characterize the potential for the occurrence of non-carcinogenic effects associated with short-term exposures [two weeks to seven years as defined by USEPA (USEPA 1989)]. The sub-chronic RfDs are developed similarly to chronic RfDs and are typically equal to chronic RfDs or are an order of magnitude greater (less stringent). Sub-chronic RfDs are presented in HEAST but are no longer being reviewed and updated in the same manner as IRIS. Because there is greater uncertainty associated with the sub-chronic RfDs, chronic RfDs have been used in this HHRA with the exception of construction worker for which the sub-chronic values (if available) are used due to exposure duration.

RfDs are derived using uncertainty factors that reflect scientific judgment regarding the various types of data used to estimate the RfD. RfDs are typically estimated from no observable adverse effect levels (NOAELs) or lowest observable adverse effect levels (LOAELs) in human or animal studies. Uncertainty factors, generally 10-fold factors, are intended to account for:

- The variation in sensitivity among members of the human population;
- The uncertainty in extrapolating animal data to the case of humans;
- The uncertainty in extrapolating from data obtained in a study that is less-than-lifetime exposure;
- The uncertainty in using LOAEL data, when necessary, rather than NOAEL data; and
- The inability of a single study to adequately address every possible adverse outcome in humans.

To derive RfDs, NOAELs or LOAELs are divided by one or more uncertainty factors, as appropriate. When taken together, these uncertainty factors may confer an extra margin of safety of up to a factor of 10,000 below a LOAEL. In some cases, modifying factors are also applied to RfDs to take into account other uncertainties in the toxicity database and reflect the professional judgment of those reviewing the database. The net result is that RfDs are generally considered to provide a conservative estimate of the likelihood of adverse non-carcinogenic effects.

6.3.1.3 Adjustment for Dermal Absorption

Toxicity criteria have not been developed by USEPA specifically for dermal absorption; instead, oral toxicity criteria are adjusted to assess this pathway. In order to have a meaningful comparison between the dermal absorption dose estimates, which represent internal (or absorbed) doses, and oral toxicity criteria, which typically represent potential (or administered) doses, toxicity criteria are modified to represent absorbed doses. The method for modifying toxicity criteria involves calculation of an absolute

oral absorption factor for each chemical and use of this value to increase the chemical's CSF or to decrease the chemical's RfD, as shown in the following equations:

- Adjusted Dermal CSF = CSF/Absolute oral absorption factor; and
- Adjusted Dermal RfD = RfD x Absolute oral absorption factor.

The absolute oral absorption factors should reflect the specific conditions under which the toxicological study was conducted (e.g., method of administration such as gavage, water or diet, and vehicle of administration such as solvent or solution). The absolute oral absorption factors and adjusted toxicity criteria for the COPCs used when evaluating dermal absorption are presented in RAGS D Tables E.1-5.1 and E.1-6.1. The adjusted CSFs and RfDs presented in these tables were used to evaluate potential risks associated with dermal absorption.

6.4 RISK CHARACTERIZATION

Quantitative risks and hazards due to exposure to COPCs are estimated and summarized by combining toxicity criteria (presented in the Toxicity Assessment) with CDIs and exposure concentrations (calculated in the Exposure Assessment). Methods used to calculate risks and hazards are taken from (USEPA 1989b).

For exposures to potential carcinogens, the individual upper-bound excess lifetime cancer risk was calculated by multiplying the estimated CDI or exposure concentration for each COPC by the CSF. In order to assess the individual excess lifetime cancer risks associated with simultaneous exposure to COPCs, the risks derived from the individual chemicals are summed within each exposure pathway. For the residential scenario, carcinogenic risk was evaluated for the lifetime resident. In addition, carcinogenic risk for the residential scenario for carcinogens that act via a mutagenic mode of action (i.e., benzo(a)pyrene) as identified in the September 2008 Regional Screening Table were evaluated utilizing default age-dependant adjustment factors in accordance with the Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens (USEPA 2005a).

Non-carcinogenic adverse health effects are calculated by dividing the CDI for each COPC by its RfD or the exposure concentration for inhalation for each COPC by its RfC, forming a HQ. HQs greater than one (1) indicate the potential for adverse health effects. To estimate non-carcinogenic adverse health effects due to simultaneous exposure to several COPCs, HQs for individual COPCs are summed within each exposure pathway to form a HI. As with HQs, HIs that are greater than 1 indicate potential adverse health effects. In such cases, COPCs are divided into categories based on the target organ affected (e.g., liver, kidney) and target organ-specific HIs are recalculated. Non-carcinogenic hazards were evaluated for child and adult residents independently.

Excess lifetime cancer risks derived in this report are compared to USEPA's target risk range for Superfund sites of 1E-06 to 1E-04 (USEPA 1989). In addition, USEPA's Office of Solid Waste and Emergency Response has issued a directive (USEPA 1991) clarifying the role of HHRA in the Superfund process. The directive states that, if the cumulative carcinogenic risk to a receptor (based on reasonable maximum exposure for both current and future land use) is less than 1E-04 and the non-carcinogenic HI is equal to or less than 1, action generally is not warranted unless adverse environmental effects are likely.

Calculation of risks and hazards due to exposure to COPCs are presented in Appendix E.1 in Tables E.1-7.1 through E.1-7.12. A refinement of the HIs based on target organs is conducted. As shown in Appendix E.1 in Tables E.1-9.1 through E.1-9.12, the refinement consists of calculating HIs based on a target organ-specific basis. In addition in Appendix E.1, Table E.1-10.1 summarizes risks and hazards for risk/HI drivers (i.e., those COPCs contributing to a total risk greater than 1.E-04 or a total target organ hazard greater than 1).

Risks and hazards presented in Appendix E.1 in Tables E.1-9.1 through E.1-9.12 are summarized in the tables below. The total risk for each receptor is below or within USEPA's target risk range for Superfund sites (1E-06 to 1E-04, USEPA 1989). The total HIs after target organ segregation for all receptors are

equal to or below the USEPA reference HI of 1E+00 with the exception of the hypothetical future construction worker (CNS).

Summary of Risks and Hazards

Timeframe/Receptor	Risk	HI	Risk Drivers	Target Organ Segregation HI>1
Current Maintenance Worker (Surface Soil)	4.E-07	0.06	None	None
Future Maintenance Worker (Total Soil)	4.E-07	0.05	None	None
Current Adolescent Trespasser (Surface Soil)	2.E-07	0.05	None	None
Future Adolescent Trespasser (Total Soil)	2.E-07	0.05	None	None
Hypothetical Future Commercial Worker (Total Soil)	1.E-06	0.2	None	None
Hypothetical Future Construction Worker (Total Soil)	6.E-07	**6**	None	CNS (HI=5) – Soil (Al – Inh (0.6), Mn – Inh (4))
Hypothetical Future Adult Resident (Surface Soil)	See Lifetime Resident	0.4	NA	None
Hypothetical Future Adult Resident (Total Soil)	See Lifetime Resident	0.4	NA	None
Hypothetical Future Child Resident (Surface Soil)	See Lifetime Resident	**3.5**	NA	None
Hypothetical Future Child Resident (Total Soil)	See Lifetime Resident	**3**	NA	None
Hypothetical Lifetime Resident (Surface Soil)	2.E-05	NA	None	NA
Hypothetical Lifetime Resident (Total Soil)	2.E-05	NA	None	NA

Note: NA = Not Applicable
CNS = Central Nervous System
Al = Aluminum, Mn = Manganese
Inh = Inhalation
HI = Hazard Index
Bold = Above USEPA Risk or Hazard Range
Segregated Target Organ HIs provided in Appendix E.1, Table 9's

6.4.1 Lead Exposure Assessment

The MDC for lead in surface soil and total soil for the study was above the residential lead screening level of 400 mg/kg, and therefore, the potential hazard associated with lead was evaluated using the Integrated Exposure Uptake Biokinetic (IEUBK) model for the child resident scenario (USEPA 2007a) and the EPA Adult Lead Model (USEPA 2005b) for adult workers.

Site-specific lead exposures were evaluated for residential exposures at the RFI study area using the IEUBK model. The results of the model are presented in Appendix E.2. The corresponding input parameters and distribution probability plot are also provided in the Appendix E.2. The results of the modeling presented in Appendix E.2 predict the probability of children expected to have blood levels of 10 microgram per deciliter (μg/dL) or greater. The lead risks are considered unacceptable if the child-blood lead level for more than 5% of children is estimated to be equal to or greater than the Center for Disease Control and Prevention (CDCP) threshold of 10 μg/dL.

USEPA developed a physiologically-based pharmacokinetic adult lead model (ALM) (version 05/19/2005) that can be applied to adult worker receptors. The ALM is currently the accepted and standard model to assess adult non-residential exposures to lead in soil and indoor dust. The model uses a simplified representation of lead biokinetics to predict quasi steady-state blood level concentrations among adults who have relatively steady patterns of site exposures. The methodology focuses on estimating fetal blood lead concentrations in female workers. All of the equations in the model are used to calculate target concentrations based on the probability of a blood lead level equal to or greater than 10 μg/dL for a fetus. Lead risks are considered unacceptable for a non-residential (worker) receptor if the fetal blood lead level for more than 5% of fetuses of adult female workers is estimated to equal or greater than the CDCP concern threshold of 10 μg/dL. The ALM is used to evaluate risks of lead exposure to the fetus of pregnant female commercial workers, construction workers, and other workers that are identified as relevant receptors at a site.

6.4.1.1 Lead Exposure Assessment

Default parameters were utilized for the ALM with the following ingestion rates and exposure frequencies: maintenance worker – ingestion rate (100 mg/day) and exposure frequency (219 days), commercial worker – ingestion rate (50 mg/day) and exposure frequency (250 days), and construction worker – ingestion rate (100 mg/day) and exposure frequency (250 days). Default parameters were used for the IEUBK model. An arithmetic mean for lead of 313.9 mg/kg was used in the models for surface soil and an arithmetic mean for lead of 414.9 mg/kg was used in the models for total soil. Lead was not detected in groundwater at SWMU 13; therefore, the reporting limit for lead (1 μg/L) was used in the model for the lead concentration in groundwater. The lead modeling predicts the probability of the receptors to have blood levels of 10 μg/dL or greater. This probability is then compared to an established threshold of 5%. The results of the ALMs for the South region/all ethnicities and IEUBK models are presented in Appendix E.2 and summarized below:

- Current/Future Maintenance Worker (Surface Soil): 1.5% probability that fetal blood levels would be greater than 10 μg/dL (<5%);
- Hypothetical Future Maintenance Worker (Total Soil): 2.3% probability that fetal blood levels would be greater than 10 μg/dL (<5%);
- Hypothetical Future Commercial Worker: 0.9% probability that fetal blood levels would be greater than 10 μg/dL (<5%);
- Hypothetical Future Construction Worker: 2.8% probability that fetal blood levels would be greater than 10 μg/dL (<5%);

- Hypothetical Future Child resident (Surface Soil): 1.4% probability that child blood levels would be greater than 10 μg/dL (<5%); and
- Hypothetical Future Child resident (Total Soil): 4.1% probability that child blood levels would be greater than 10 μg/dL (<5%).

The results of the lead modeling predicted the probability of the receptors for the RFI study area expected to have blood levels of 10 μg/dL or greater were below the established threshold of 5%.

6.4.2 Background

Statistical evaluations were conducted to compare metals concentrations in soil at the RFI study area to background concentrations presented in the RFAAP Facility-Wide Background Study Report (IT 2001). These evaluations followed the procedures outlined in the USEPA *Guidance for Comparing Background and Chemical Concentrations in Soil for CERCLA Sites* (USEPA 2002a) and included distribution testing and comparisons of site data to background using ProUCL 4.0 (USEPA 2007c). At the RFI study area, if the distribution testing showed that either site data sets and background data sets in each case were not normal, consistent with Section 4.1 of the above referenced USEPA guidance, comparisons of site to background were conducted using non-parametric testing to evaluate whether site concentrations were consistently higher or lower than the background data set. If the distribution of the site and background data sets were both distributed normally, a paired t-test was conducted to evaluate whether site concentrations were consistently higher or lower than the background data set unless non-detects were present in either data set then the default comparison using ProUCL 4.0 is nonparametric. Appendix D.2 presents the results of the statistical evaluations. Summaries of the means comparison results are provided Appendix D.2, Tables D.2.-1a (surface soil) and D.2-1b (total soil).

Based on the background evaluations presented in Appendix D.2, COPCs identified for the RFI study area that are consistently lower than background include arsenic, cobalt, manganese, and vanadium for surface soil and aluminum, arsenic, cobalt, iron, thallium, and vanadium for total soil. Note that background comparisons could not be conducted for antimony (surface and total soil) due to the number of detections in the background data set.

Recent investigations conducted within flood plain areas at RFAAP (SWMUs 54, 45, 35, 37, 38, and AOC Q), have indicated naturally occurring manganese levels in alluvial soil that are consistently similar to or above facility background, when tests are conducted using means comparisons (t-test or rank sum) but substantially below the background point estimate of 2,543 mg/kg. A similar situation is apparent at the RFI study area, where total manganese concentrations in soil are consistently above the background data set when means tests are conducted, but detected manganese concentration are below the background point estimate.

As presented in the SWMU 54 RFI/CMS Report (URS 2008b), further statistical evaluation of the nature of manganese concentrations at SWMU 54 was conducted utilizing background samples located outside of the site area between the perimeter fence and the New River. SWMU 54 is located downstream of the RFI study area at SWMU 13 within the HSA (Figure 2-10). SWMU 54 and the RFI study area exhibit similar geology (i.e., alluvial in nature); therefore, a statistical evaluation of manganese (total) soil data was conducted for the RFI study area and the background area at SWMU 54. As presented in Appendix D.3, a non-parametric Wilcoxon-Mann-Whitney Test was conducted given the non-normal distribution of manganese for the SWMU 54 background data. The result of these evaluations indicated that the concentrations of manganese for the samples from the RFI study area at SWMU 13 were equal to or below the concentrations of manganese for the background samples from SWMU 54. Based on the results of this evaluation, the concentrations of manganese for total soil within the RFI study area were considered to be within background for alluvial soil and not indicative of effects from operational activities at the OBG on the RFI study area.

6.5 HHRA SUMMARY AND CONCLUSIONS

This HHRA was performed to evaluate the potential human health effects associated with previous activities adjacent to the RFI study area. Receptors evaluated included: current/future maintenance worker, current/future adolescent trespasser, hypothetical future construction worker, hypothetical future commercial worker, hypothetical future adult resident, hypothetical future child resident, and hypothetical future lifetime resident.

As presented in Section 6.4, the total risk for each receptor is below or within USEPA's target risk range for Superfund sites (1E-06 to 1E-04, USEPA 1989). The results of the lead modeling predicted the probability of the receptors expected to have blood levels of 10 μg/dL or greater were below the established threshold of 5%. The total HIs after target organ segregation for all receptors are equal to or below the USEPA reference HI of 1E+00 with the exception of the hypothetical future construction worker (CNS) due to aluminum and manganese concentrations in total soil via the inhalation pathway (CNS HI of 5). COPCs contributing to the CNS HI of 5 for the construction worker (arsenic, aluminum, and manganese) were below background; therefore, the site-related CNS hazard for the construction worker is negligible at the site.

6.6 UNCERTAINTIES ANALYSIS

Risk assessments involve the use of assumptions, judgments, and incomplete data to varying degrees that contribute to the uncertainty of the final estimates of risk. Uncertainties result both from the use of assumptions or models in lieu of actual data and from the error inherent in the estimation of risk related parameters and may cause risk to be overestimated or underestimated. Based on the uncertainties described below, this risk assessment should not be construed as presenting an absolute estimate of risk to persons potentially exposed to COPCs.

Consideration of the uncertainty attached to various aspects of the risk assessment allows better interpretation of the risk assessment results and understanding of the potential adverse effects on human health. In general, the primary sources of uncertainty are associated with environmental sampling and analysis, selection of chemicals for evaluation, toxicological data, and exposure assessment. The effects of these uncertainties on the risk estimates are discussed below.

6.6.1 Environmental Sampling and Analysis

If the samples do not adequately represent media at the RFI study area, hazard/risk estimates could be overestimated or underestimated. The sampling and analysis plan was designed to investigate anticipated areas of concern at the SWMU. Therefore, there is less chance that the hazard/risk estimates are biased low. Also, if the analytical methods used do not apply to some chemicals that are present at the site, risk could be underestimated. Because the analytical methods at the site were selected to address all chemicals that are known or suspected to be present on the basis of the site history, the potential for not identifying a COPC is reduced.

Uncertainty in environmental chemical analysis can stem from several sources including errors inherent in the sampling or analytical procedures. Analytical accuracy errors or sampling errors can result in rejection of data, which decreases the available data for use in the HHRA, or in the qualification of data, which increases the uncertainty in the detected chemical concentrations. There is uncertainty associated with chemicals reported in samples at concentrations below the method reporting limit but still included in data analysis and with those chemicals qualified "J" indicating that the concentrations are estimated. Another issue involves the amount of blank related (i.e., B-qualified) data in the data set. These data were retained in the HHRA without modification. The inclusion of "B" qualified data in the risk assessment may overestimate risk.

Another uncertainty associated with sampling and analysis concerns the inclusion of chemicals that are potentially present in the environment due to anthropogenic sources. For example, PAHs are considered ubiquitous in soil from anthropogenic sources, such as the burning of fossil fuels, forest fires, and

airborne particulates eroded from roadways and automobile tires. If such chemicals are not site-related, the risks associated with the site may be overestimated. This uncertainty may have a low-to-moderate effect on overestimating risks.

6.6.2 Selection of Chemicals for Evaluation

A comparison of maximum detected chemical concentrations to USEPA RSLs was conducted for both surface and total soil. Chemicals whose maximum concentrations were below their respective RSLs were not carried through the assessment. It is unlikely that this risk based screening excluded chemicals that should be included, based on the conservative exposure assumptions and conservatively derived toxicity criteria that are the basis of the RSLs. Although following this methodology does not provide a quantitative risk estimate for every chemical, it focuses the assessment on the chemicals accounting for the greatest risks (i.e., chemicals whose maximum concentrations are above their respective RSLs) and the cumulative risk estimates would not be expected to be significantly greater. As presented on the non-detect MDL screening tables in Appendix E.1, Table E.1-2.3, the maximum MDL is above the adjusted RSLs for only one target analyte (herbicide MCPP) in one soil sample; therefore, the site-related risks and hazards are not considered significantly underestimated for the risk assessments due to inadequate detection limits.

Background concentrations of metals in soil at RFAAP have been characterized and are used in statistical comparisons to site soil to evaluate whether concentrations of metals detected at the RFI study area are consistently higher or lower than background. Uncertainties associated with the use of these data may lead to a low-to-moderate overestimation or underestimation of surface and total soil risks due to metals.

Screening criteria are derived from RDAs for essential human dietary minerals, trace elements, and electrolytes that are toxic at very high doses (i.e., calcium, magnesium, potassium, and sodium). Omitting these essential human nutrients from further evaluation is expected to have a low effect on risk and hazard estimates.

The use of the Regional SL Table (USEPA 2008) rather than the April 2009 Regional SL Table for the COPC selection could result in the inclusion or exclusion of chemicals based on outdated toxicity data. Therefore to lessen the uncertainty associated with the use of these screening levels, an assessment of the data was conducted with respect to the April 2009 Regional Screening Levels which did not result in the identification of any additional COPCs for the site.

6.6.3 Exposure Assessment

The primary areas of uncertainty affecting exposure parameter estimation involve the assumptions regarding exposure pathways, the estimation of exposure point concentrations, and the exposure parameters used to estimate chemical doses.

An underlying assumption in the HHRA is that individuals at the site would engage in activities that result in exposures via each selected pathway. For example, it was assumed that maintenance workers engage in regular activities (once a week) under current and future land use conditions resulting in exposure to COPCs. This assumption is conservative, in that it is more likely that the activity patterns occur occasionally.

In establishing EPCs, the concentrations of chemicals in the media evaluated are assumed to remain constant over time. Depending on the properties of the chemical and the media in which it was detected, this assumption could over estimate risks, depending on the degree of chemical transport to other media or the rate and extent a chemical degrades over time.

When calculating EPCs from sample data, one half of the MDL was sometimes used for non-detect samples in the calculation of the 95% UCL of the mean. Approaches which substitutes values for non-detected chemical concentrations are associated with uncertainty, because chemicals that were not detected at the specified sample MDL may be absent from the medium or may be present at a concentration below the sample MDL. The uncertainty of the exposure point concentration will increase

as the number of non-detects in a data set increases and the uncertainty could result in either the overestimation or underestimation of EPCs.

The exposure parameters used to describe the extent, frequency, and duration of exposure is associated with uncertainty. Actual risks for individuals within an exposed population may differ from those predicted, depending upon their actual intake rates (e.g., soil ingestion rates), nutritional status, or body weight. Exposure assumptions were selected to produce an upper bound estimate of exposure in accordance with USEPA guidelines regarding evaluation of potential exposures at Superfund sites (e.g., exposures were assumed to occur for 25 years for workers). In addition, many USEPA default exposure parameters are highly conservative and are based on risk management interpretations of limited data (USEPA 1991). For example, although current USEPA guidance recommends default soil ingestion rates of 100 mg/day for individuals over 6 years of age, other studies, such as Calabrese et al. (1990), have shown that the USEPA default soil ingestion rate of 100 mg/day is likely to greatly overestimate adult exposures and risks. In addition, chemicals in soil are assumed 100% bioavailable; this assumes that ingested chemicals present in a soil matrix are absorbed through the gastrointestinal (GI) tract, which is unlikely due to the affinity of chemicals for soil particles. Therefore, based on the conservative exposure assumptions used in the HHRA, exposures and estimated potential risks are likely to be overestimated for the ingestion of soil pathways.

Evaluation of the dermal absorption exposure pathway is affected by uncertainties in dermal exposure parameters. For example, there is uncertainty associated with the exposed skin surface areas used, since the choice of exposed body parts could slightly overestimate or underestimate risks. Uncertainties that are more significant are associated with the selection and use of dermal absorption factors. For this HHRA, the dermal absorption factors and calculations were based on USEPA Region III guidance, USEPA's *Risk Assessment Guidance for Superfund (RAGS): Part E, Supplemental Guidance for Dermal Risk Assessment* (USEPA 2004). Very limited information is available on dermal absorption of chemicals from contacted soil under environmental conditions. In fact, there are not actual human epidemiological data to support the hypothesis that absorption of soil bound compounds under exposure conditions is a complete route of exposure. For example, the Public Health Statements from the Agency for Toxic Substance Disease Registry (ATSDR 1999b) indicates cadmium is not known to result in human health effects by dermal absorption because virtually zero cadmium can enter the body through the skin under normal circumstances (i.e., without exposure to very high concentrations for long periods or exposure to skin that is damaged (ATSDR 1999a). Therefore, using the dermal absorption factors to evaluate dermal absorption exposures to soil may result in an overestimation of risks.

6.6.4 Toxicological Data

The HHRA relies on USEPA derived dose response criteria. These health effects criteria are conservative and are designed to be protective of sensitive subpopulations. The health criteria used to evaluate long-term exposures, such as RfDs or CSFs, are based on concepts and assumptions that bias an evaluation in the direction of overestimation of health risk. As USEPA notes in its *Guidelines for Carcinogenic Risk Assessment* (USEPA 1986a), there are major uncertainties in extrapolating both from animals to humans and from high to low doses. There are important species differences in uptake, metabolism, and organ distribution of carcinogens, as well as species and strain differences in target site susceptibility, human populations are variable with respect to genetic constitution, diet, occupational and home environment, activity patterns, and other cultural factors.

These uncertainties are compensated for using upper bound 95% UCLs for CSFs (carcinogens), and safety factors for RfDs (non-carcinogens). The assumptions used here provide a rough but plausible estimate of the upper limit of risk; in other words, it is not likely that the true risk would be much more than the estimated risk, but it could very well be considerably lower. More refined modeling in the area of dose response calculation (e.g., using maximum likelihood dose response values rather than the 95% UCL) would be expected to substantially lower the final risk.

For dermal absorption exposure pathways, the absence of dermal toxicity criteria necessitates the use of oral toxicity data. To calculate risk estimates for the dermal absorption pathway, absorbed dermal absorption doses are combined with oral toxicity values (also discussed above in Section 6.3.1.3). Oral toxicity values, which are typically expressed in terms of potential (or administered) doses, should be adjusted when assessing dermal absorption doses, which are expressed as internal (or absorbed) doses. In this assessment, absolute oral absorption factors that reflect the toxicity study conditions were used to modify the oral toxicity criteria. For those chemicals lacking sufficient information, a default oral absorption factor of 1.0 was used. The risk estimates for the dermal absorption pathways may be overestimated or underestimated, depending on how the values used in the HHRA reflect the difference between the oral and dermal routes.

Inhalation toxicity criteria are unavailable for many of the COPCs. This HHRA does not use oral-based toxicity criteria to estimate risks from inhalation exposure because of the following uncertainties associated with such a substitution:

- Many chemicals show portal-of-entry toxicity – that is, adverse health effects occur primarily at the tissue site at which the chemical is introduced into the body (e.g., GI tract, lung, or skin). For example, orally administered benzo(a)pyrene is associated with benign and malignant tumors in the gut mucosa (Neal and Rigdon 1967), but inhaled benzo(a)pyrene produces an increased incidence of upper respiratory tract tumors (Thyssen et al. 1981). Therefore, quantitative risk estimates based on these two administration routes are dissimilar;

- Physiological and anatomical differences between the GI tract and respiratory systems invalidate a cross-route quantitative risk extrapolation. The small intestine of humans contains a very large surface area that readily absorbs most compounds by passive diffusion (Klaasen et al. 1986). The oral absorption of a few compounds, such as iron, is an energy-dependent (active-transport) process, wherein; the absorption rate is proportional to the body's current need for iron;

- The rate and extent of pulmonary absorption are much more complex and depend on such factors as particle size distribution of the airborne toxicant and blood-gas solubility of the toxicant (Klaasen et al. 1986). Particles with median aerodynamic diameters of approximately 1 micrometer (μm) or less are absorbed by the alveolar region of the human lung. Larger particles deposit in the tracheobronchial or nasopharyngeal regions where they are cleared by mucociliary mechanisms and subsequently swallowed or physically removed and exhaled. Therefore, pulmonary absorption is more highly dependent on the physiochemical properties of the material than oral absorption;

- Because highly soluble gases (e.g., chloroform) are more rapidly absorbed into the blood than poorly soluble gases (e.g., ethylene), they take much longer to reach equilibrium. Thus, the inhalation absorption rate of a gas is more dependent on blood solubility than the oral absorption rate of the same substance administered as a liquid; and

- Human inhalation risk estimates based on oral toxicity data in subhuman species are distorted by both route-to-route extrapolation and interspecies extrapolation. For example, the rodent GI tract, which includes a structurally unique fore stomach, is anatomically and functionally distinct from the human lung, which contains a very large alveolar surface area for extensive absorption. The rate and extent of absorption across these distinct physiological systems are not alike.

In addition, for inhalation exposure to substances present as dusts, vapors, gases, or airborne particulate matter, dose extrapolation is far more complex, and therefore associated with uncertainty. The major confounding factors that prohibit a direct dose extrapolation of an inhaled toxicant are the following:

- Over 40 functionally different cell types in the lung – the distribution, consequent metabolic reactions, and air exchange rates vary widely across species;

- Differential concentration and activity of the detoxifying protein glutathione;
- Interspecies and intraspecies differences in the ability to repair pulmonary cell damage, and to clear toxic chemicals and immune complexes from the respiratory tract. For example, species vary in the ability to activate macrophages – nonspecific immune cells that can both protect the inner lining of the respiratory system and, at high concentrations, damage healthy tissues;
- Anatomical variations in the respiratory pathway, which affect both absorption rates and time to reach steady-state blood levels; and
- Sensitivity to solubility and concentration variables; because of metabolic saturation (i.e., the exhaustion of normal metabolic activity caused by exposure to high concentrations), highly soluble chemicals deviate from first-order kinetics – which makes it difficult to predict the rates and extent of biotransformation and detoxification reactions. Furthermore, intermittent inhalation exposure to highly blood-soluble chemicals results in bioaccumulation in fat tissue because of the insufficient time between exposure sessions for complete clearance of the chemical. Such slow release from the fat compartment to other body tissues can result in toxicological and metabolic effects that are difficult to assess and vary across species.

For chemicals without IRIS toxicity criteria, provisional toxicity criteria were used where available (Appendix E.1 - Tables E.1-5.1 through E.1-6.2). Provisional toxicity criteria present a source of uncertainty, since USEPA has evaluated the compound, but consensus has not been established on the toxicity criteria. Provisional oral toxicity values were used for aluminum, antimony, arsenic, carbazole, cobalt, iron, thallium, vanadium, and nitroglycerin. For this assessment, use of provisional toxicity criteria was preferable to not evaluating the chemical in order to limit data gaps. However, because these toxicity criteria have not been formally accepted by USEPA, there is uncertainty with these values and, therefore, with the risks calculated using these toxicity criteria.

Some detected constituents (carbazole, dibenzofuran, and dimethylphthalate) do not have Regional RSLs and were therefore carried forward as COPCs into the HHRA. Provisional/surrogate toxicity values were not available for these COPCs with the exception of carbazole. The risk assessment could be biased low due to the lack of toxicity data for these COPCs.

For some chemicals, toxicity criteria for all pathways (i.e., oral, dermal, and inhalation) were unavailable (Appendix E.1 -Tables E.1-5.1 through E.1-6.2). Although lack of published toxicity data could result in an underestimation of risk, an attempt is made to balance this uncertainty with the use of available toxicological data derived using conservative methodologies.

6.6.5 Risk Characterization

Minor uncertainty is associated with rounding of the risk and hazard estimates. Thus, the actual risk or hazard may be slightly greater or less than the presented values. A related issue is that rounding causes minor differences between summed risk and hazard values, depending on how the summing is performed. For example, RAGS Table 7s in Appendix E.1 presents risks and hazards that are summed for exposure route, exposure point, exposure medium, and medium total. Only for the first (exposure route) are the individual chemical-specific risks and hazards summed to derive the total. For the subsequent summations (exposure point, exposure medium, and medium total), each is the summation of the preceding sums. For this reason, there can be minor rounding-related differences between the same risk and hazard summed values presented in RAGS Table 7s verses RAGS Tables 9s and Table 10s. RAGS tables are provided in Appendix E.1.

Notes:

CAS = Chemical Abstracts Service
pg/g = Picogram per gram
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code

Data Qualifiers:
A = Amount detected is less than the Lower Calibration Limit.
J = Analyte present. Reported value may not be accurate or precise.

RSL = Regional Screening Level (RSL) from October 2008 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
-- = No Value Available

Key per October 2008 Regional RSL Table:
c = cancer
n = noncancer
c* = cancer where n SL < 100X c SL
c** = cancer where n SL <10X c SL
m = concentration may exceed ceiling
s = concentration may exceed Csat

TEF = Toxicity Equivalency Factor (WHO 2005)

Total 2,3,7,8-TCDD Equivalents are calculated by summing the detected concentration times the TEF for each chemical. Non-detects, R-flagged data, and B-flagged data are excluded from summed total.

= Concentration Exceeds Adjusted Soil Residential RSL

= Concentration Exceeds Adjusted Soil Industrial RSL

7.0 ECOLOGICAL RISK SCREENING PROCESS

The purpose of the ecological risk screening is to provide conclusions and recommendations regarding potential ecological risk associated with the RFI study area. The Screening Level Ecological Risk Assessment (SLERA) was performed in accordance with the Final Process for Ecological Risk Assessment – Radford AAP (URS 2007b). The SLERA process is summarized below in Sections 7.1 through 7.8. Refer to Appendix F.1 for a detailed description of the SLERA process utilized for the site evaluations and an example calculation. A summary of the SLERA results are provided below and the complete tables for the SLERA are provided in Appendix F.2.

7.1 SCOPE OF WORK

The SLERA includes Steps 1, 2, and 3a of Ecological Risk Assessment Guidance for Superfund [ERAGS] (USEPA 1997b). Step 1 includes a screening-level problem formulation and ecological effects evaluation. Step 2 includes a preliminary exposure estimate and risk calculation. Step 3a reviews and refines the conservative assumptions used in the risk calculation (Step 2). The addition of Step 3a focuses the outcome of the SLERA, streamlines the review process, and functions as the initial basis for ecological risk management decision making.

The objectives of the ecological risk screening are to:

- Identify potentially complete exposure pathways between COPECs and receptors;
- Assess whether the COPECs are above toxicological screening values that are considered to be protective of ecological receptors;
- Identify uncertainty and/or data gaps in the ecological risk screening; and
- Identify an appropriate SMDP for the site area based on the ecological risk screening results.

7.1.1 Ecological Site Characterization

An overview of the site physiography, water resources, geology, and soil is presented in Section 2.0. The RFI study area is located in the western section of the HSA between the perimeter berm of the OBG and the north bank of the New River. This area is approximately 1,700 feet (ft) long and 40 to 60 ft wide or approximately 1.6 acres. The RFI study area is vegetated with tall grass and stands of trees, and it is located in the 100-year flood plain of the New River (see photographic log, Appendix A). Indications of chemical vegetative stress were not observed.

In addition to the information contained in Section 2.0, additional site characterization is required for the ecological risk screening, which includes local ecological receptors (threatened and endangered species) and ecological resources. A discussion of potential biota likely to use the site area is included in this section. During site visits, wildlife species were observed at the site such as squirrels. Deer tracks were also observed in the area.

The Virginia Department of Game and Inland Fisheries Installation-Wide Biological Survey (VDGIF 1999) recorded various species associated with the grassland communities at RFAAP. Based on their survey of the grassland habitats, the invertebrates (approximately 250 species) and birds (83 species) accounted for the majority of species observations at RFAAP. Potential species utilizing the grassland areas of the site include common passerine birds (e.g., American robin) and small mammals (e.g., short-tailed shrew). Larger mammals (e.g., white-tailed deer and red fox) and raptors (e.g., red-tailed hawk) may potentially utilize the grassland habitat for foraging. Animals such as the mallard duck, belted kingfisher, and raccoon could be expected to forage in the New River.

The Virginia Department of Game and Inland Fisheries survey identified three threatened wildlife species and two rare plant species associated with RFAAP grassland communities (currently not on the 2002 Plant Watch List; http://www.dcr.state.va.us/dnh/plantlist02.pdf). They include:

- Regal Fritillary Butterfly (*Speyeria idalia*);
- Henslow's Sparrow (*Ammodramus henslowii*);
- Loggerhead Shrike (*Lanius ludovicianus*);
- Midland Sedge (*Carex mescochorea*); and
- Shaggy False Gromwell (*Onosmodium hispidissimum*).

Threatened wildlife observations in 1999 at RFAAP included the Regal Fritillary Butterfly (VDGIF 1999). The Regal Fritillary Butterfly was documented in the east-central and eastern edges of the MMA. No threatened wildlife species or rare plant species were identified at the site.

7.2 IDENTIFICATION OF CHEMICALS OF POTENTIAL ECOLOGICAL CONCERN

7.2.1 Approach

Soil samples were collected from 0 to 1 ft bgs below organic layers at the surface. This layer contains the zone of highest biological activity of soil organisms and the soil that is most frequently contacted by terrestrial biota. Although fossorial wildlife may be in contact with soil below 1 ft bgs, the preys of these animals are primarily associated with surficial soil. Furthermore, incidental exposure to the soil below 1 ft bgs is likely to be insignificant relative to surface soil exposure.

Surficial soil (0 to 1 ft bgs) represents the potential exposure media to ecological receptors. The following sections describe the process used to evaluate soil, the selection of COPECs evaluated in the SLERA, and the uncertainties associated with COPEC selection.

7.2.2 Terrestrial

Potential ecological receptors at the RFI study area may be exposed to COPECs in soil through the following exposure routes:

- Direct contact/absorption from soil;
- Direct ingestion of soil;
- Incidental ingestion of soil; and
- Direct ingestion of biota with accumulated COPECs.

Although receptors may be exposed to COPECs through inhalation or drinking surface water, sufficient literature regarding toxicity due to these pathways is lacking to quantitatively evaluate such exposure routes. Given the potential mobility of COPECs between food web trophic levels, a number of terrestrial categories were selected. Individual receptor species were selected to represent five wildlife receptor categories and these species possess the following characteristics that are essential for assessing COPEC mobility within the food web:

- Highly likely to occur at the site;
- Limited home range;
- Important role in the local food web; and

- Sufficient toxicological information is available in the literature.

Receptor categories and the species selected to represent the wildlife categories include:

- Plant communities;
- Soil invertebrate/microbial communities;
- Omnivorous birds: American Robin (*Turdus migratorius*);
- Carnivorous birds: Red-tailed Hawk (*Buteo jamaicensis*);
- Herbivorous animals: Meadow Vole (*Microtus pennsylvanicus*);
- Omnivorous mammals: Red Fox (*Vulpes vulpes*); and
- Carnivorous mammals: Short-tailed Shrew (*Blarina brevicauda*).

Potential wildlife utilizing the site includes passerine bird and small mammalian species common to RFAAP grasslands (VDGIF 1999).

7.3 IDENTIFICATION OF EXPOSURE PATHWAYS AND POTENTIAL RECEPTORS ANALYSIS

7.3.1 Data Organization

The following table identifies the soil samples used for the SLERA. Each of these samples was analyzed for lead. Samples 13SB7A through 13SB11A were analyzed for TAL metals, TCL pesticides, TCL PCBs (selected samples), TCL herbicides (selected samples), TCL VOCs, TCL SVOCs, explosives (including nitroglycerin and PETN), PAHs, and dioxin/furans (selected samples). Samples 13SB13A through 13SB22A were analyzed for TAL metals, TCL SVOCs, explosives, and nitroglycerin/PETN. Refer to Table 3-1 for a detailed list of samples and analytes.

Soil Samples Evaluated for SLERA

Detected chemical occurrence and distribution tables for surface soil are presented in Table F.2-1. Refer to Table 4-1 for a complete list of results for detected analytes. In addition, to evaluate the adequate sensitivity of the MDL for the necessary screening levels, Table F.2-2 provides a screening of the maximum MDL versus available ecological screening values for non-detected chemicals in surface soil.

Chemicals that were not detected in at least one sample were considered as uncertain analytes in the evaluation of risk. Other qualified analytical data were retained in the assessment. Data from duplicate sample pairs are averaged and treated as one result. If an analyte is detected in one of the sample pair,

one half the detection limit of the non-detect is averaged with the detected result and the result is considered detected.

In cases where chemicals were analyzed using multiple laboratory methods, the analytical results for the method with the lowest MDL were retained for the risk assessment. For example, concentrations of explosives were assessed using Method 8330 rather than the SVOC Method 8270. Eliminating the method having the higher detection limit did not result in exclusion of samples with higher detected concentrations.

7.3.2 Ecological Conceptual Site Model (ECSM)

The terrestrial ECSM is presented on Figure 7-1. Surface soil is a potential exposure medium of concern based on historical activities at the site. Based on the site characterization and data, the terrestrial receptor exposure to surface soil pathway exists.

7.4 IDENTIFICATION OF ASSESSMENT AND MEASUREMENT ENDPOINTS

Assessment endpoints are explicit statements of ecological resources (entities) and attributes of those entities that are important to protect (USEPA 1998). Measurement endpoints represent quantifiable ecological characteristics that can be measured, interpreted, and related to ecological resources chosen as assessment endpoints. Assessment and measurement endpoints for the resources in the terrestrial site are outlined below.

7.4.1 Terrestrial

Assessment and measurement endpoints for terrestrial receptors are as follows:

Assessment Endpoints	Measurement Endpoints
• Survival, growth, and reproduction of terrestrial plants	• MDCs for chemicals detected in surface soil will be compared to concentrations representing no adverse effects thresholds to the survival of plants communities reported in the scientific literature
• Survival, growth, and reproduction of soil invertebrates and microbial communities	• MDCs for chemicals detected in surface soil will be compared to concentrations representing no adverse effects thresholds to the survival of soil invertebrates or microbial communities reported in the scientific literature
• Survival, growth, and reproduction of terrestrial wildlife (birds and mammals) populations and communities	• MDCs for detected bioaccumulative chemicals in soil will be compared to NOAELs and LOAELs associated with effects on growth, reproduction, or survival of terrestrial wildlife

7.5 PRELIMINARY EXPOSURE ESTIMATE AND ECOLOGICAL EFFECTS EVALUATION

The preliminary exposure estimate and ecological effects evaluation considers the most conservative risk scenario. Highly conservative assumptions are used to estimate COPEC exposure to terrestrial receptors for pathways to be quantitatively evaluated. Conservative toxicity reference values (TRVs) are used to evaluate the ecological effects of exposure using the two approaches discussed below.

Risk is assessed by comparing the preliminary exposure estimate (MDC) of each detected chemical to the established TRV (detailed in Appendix F.1, Section 2.1). The preliminary risk is characterized in terms of a HQ, which is expressed as:

HQ = MDC/TRV

where:

HQ = Hazard Quotient for the chemical (unitless)

MDC = Maximum Detected Concentration for chemical (mg/kg)

TRV = Screening Level for chemical (mg/kg)

An HQ of less than one indicates that the chemical alone is unlikely to cause adverse ecological effects. The potential for risk increases as the HQ increases above one. However, this result should be considered in the context of other characteristic of the exposure area. In addition, it should be noted that the calculation of chemical specific HQs does not account for multiple chemicals acting through the same exposure mechanism. The results of the preliminary exposure assessment are presented in Appendix F.2.

7.5.1 Direct Contact Approach

The maximum soil concentrations for detected chemicals are used as the preliminary exposure estimate concentrations to develop a conservative risk scenario for the direct contact pathway to soil invertebrates and terrestrial plants. The results of the preliminary exposure assessments for plants and invertebrates are provided below.

Terrestrial Plants

Preliminary direct contact HQs calculated for plants are presented in Table F.2-6 for detected chemicals. Of the detected chemicals for which screening values were available, the concentrations of aluminum, chromium, cobalt, copper, lead, manganese, selenium, thallium, vanadium, zinc, and 2,4,6-TNT resulted in HQ values that were greater than 1.

Soil Invertebrates and Microbial Communities

Preliminary direct contact HQs calculated for invertebrates are presented in Table F.2-8 for detected chemicals. Of the detected chemicals for which screening values were available, the concentrations of chromium, copper, iron, lead, manganese, mercury, vanadium, zinc, and 2,4,6-TNT resulted in HQ values that were greater than 1.

7.5.2 Dose Rate Modeling Approach

Preliminary risk characterization for wildlife receptors uses the conservative preliminary exposure estimate and ecological effects evaluation to characterize risk to potential terrestrial receptors. Risk is assessed by comparing the preliminary exposure estimate of each detected bioaccumulative chemical, as defined in Table 4-2 in *Bioaccumulative Testing and Interpretation for the Purpose of Sediment Quality Assessment, Status, and Needs*, EPA-823-R-00-001, to the TRV developed in the ecological effects evaluation. An example calculation for dose rate modeling is provided in Appendix F.1, Section 4.1, utilizing the equation below.

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \ (BAF_{food} \cdot DF) + IR_s)AF}$$

where:

C_{TRV} = NOAEL or LOAEL-based screening level (mg chemical/kg soil)
ADD = NOAEL or LOAEL (mg COPEC/kg body weight-day)
BW = Minimum Body Weight of the receptor (kg)
IR_{food} = Maximum Ingestion Rate of food (kg food ingested per day, dry weight)

BAF_{food} = Bioaccumulation Factor (BAF) of most contaminated dietary component used, specific to prey type and COPEC (ratio of mg of COPEC/kg fauna, wet weight to mg COPEC/ kg substrate, dry weight)
DF = Dietary Fraction (most contaminated dietary component assumed to be 100% of diet)
IR_s = Maximum Incidental Ingestion Rate of soil (kg substrate ingested per day, dry weight)
AF = 100% Area Use Factor

In the preliminary dose rate modeling approach, the maximum COPEC concentrations for detected bioaccumulative chemicals, along with assumptions of maximum ingestion rate, minimum body weight, 100% area use, and 100% bioavailability are used in the conservative risk scenario as the preliminary exposure estimate for soil and compared to the calculated TRVs. Preliminary receptor-specific exposure parameters are presented on Table F.2-9. A summary of the results of the preliminary exposure assessment for terrestrial wildlife is provided below.

Terrestrial Wildlife

Quantitative risk characterization for terrestrial wildlife is limited to direct ingestion of biota and incidental ingestion of soil. The preliminary risks for detected bioaccumulative chemicals are summarized in Table F.2-24 for each terrestrial wildlife receptor and the chemicals with HQs greater than 1 are characterized as follows:

Receptor	NOAEL Only HQ>1	NOAEL and LOAEL HQ>1
Meadow Vole	cadmium, 2,4,6-TNT	arsenic, copper, lead, selenium, zinc
Short-tailed Shrew	chromium, selenium, 2,3,7,8-TCDD TEQ	arsenic, cadmium, copper, lead, zinc
Red Fox	chromium, 2,4,6-trinitrotoluene	arsenic, cadmium, copper, lead, selenium, zinc, 2,3,7,8-TCDD TEQ
American Robin	2,4-DNT, 2,6-DNT	cadmium, chromium, copper, lead, mercury, selenium, zinc, 2,4,6-TNT
Red-tailed Hawk	2,4,6-TNT	lead, zinc

7.6 REFINED EXPOSURE ESTIMATE AND RISK CHARACTERIZATION

Refined exposure estimates and ecological effects are developed for two major receptor categories having complete exposure pathways to be quantitatively evaluated: 1) direct contact to plants and invertebrates, and 2) wildlife ingestion (i.e., omnivorous birds and mammals, carnivorous birds and mammals, and herbivorous mammals). The refined exposure and risk characterization, Step 3a of ERAGS, reviews and refines the conservative assumptions used in the risk calculation (USEPA 1997b). In Step 3a, conservative assumptions used in the preliminary exposure and risk characterization are replaced with more environmentally realistic assumptions to evaluate risk posed by constituents identified in the preliminary risk characterization. The addition of Step 3a focuses the outcome of the SLERA, streamlines the review process, and functions as the initial basis for ecological risk management decision-making.

As noted below for the refined exposure estimate and risk characterization, the 95% UCL is used as the exposure concentration rather than the MDC. Methods used to calculate 95% UCLs are based on guidance provided in the following documents *Calculating Upper Confidence Limits for Exposure Point Concentrations at Hazardous Waste Sites* (USEPA 2002b) and *On the Computation of a 95% Upper*

Confidence Limit of the Unknown Population Mean Based Upon Data Sets with Below Detection Limit Observations (USEPA 2006a).

In general, the method used to calculate a 95% UCL depends on: 1) the prevalence of non-detects, and 2) the data distribution (e.g., normal or lognormal). Non-detects introduce uncertainty in the data set because the true concentration may be between zero to just below the detection limit. Therefore, distributional assumptions are difficult to make for COPCs with a high rate of non-detects. ProUCL 4.0 (USEPA 2007c) is used to calculate EPCs for the site. EPCs for soil COPECs are presented in Table F.2-4 for the RFI study area (Appendix F.2)

For the refined evaluation, risk is assessed by comparing the EPC (95% UCL) of each detected chemical to the TRV. The refined risk HQ is expressed as:

$$\mathbf{HQ = EPC/TRV}$$

where:

HQ = Hazard Quotient for the chemical (unitless)

EPC = Calculated Exposure Point Concentration for chemical (mg/kg)

TRV = Screening Level for chemical (mg/kg)

An HQ of less than one indicates that the chemical alone is unlikely to cause adverse ecological effects. The potential for risk increases as the HQ increases above one. However, this result should be considered in the context of other characteristic of the exposure area. In addition, it should be noted that the calculation of chemical specific HQs does not account for multiple chemicals acting through the same exposure mechanism. The results of the preliminary exposure assessment are presented in Appendix F.2.

7.6.1 Direct Contact Approach

The refined exposure estimate for the direct contact pathway to soil invertebrate and microbial communities incorporates the 95% UCL as the exposure concentration for evaluating the COPECs using a conservative yet more realistic exposure assumption than MDCs. A summary of the results of the refined exposure assessment for plants and invertebrates is provided below.

Terrestrial Plants

Refined direct contact HQs calculated for plants are presented in Table F.2-6 for detected chemicals. Of the detected chemicals for which screening values were available, the concentrations of aluminum, chromium, cobalt, copper, lead, manganese, selenium, thallium, vanadium, and zinc resulted in refined HQ values that were greater than 1.

Soil Invertebrates and Microbial Communities

Refined direct contact HQs calculated for invertebrates are presented in Table F.2-8 for detected chemicals. Of the detected chemicals for which screening values were available, the concentrations of chromium, copper, iron, manganese, vanadium, and zinc resulted in refined HQ values that were greater than 1.

7.6.2 Dose Rate Modeling Approach

The conservative assumptions used in the preliminary exposure estimate and ecological effects evaluation were replaced with more environmentally realistic assumptions resulting in a more realistic estimate of potential risk. An example calculation for dose rate modeling is provided in Appendix F.1, Section 4.4, utilizing the equation below.

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + IR_s) AF_{refined}}$$

where:

C_{TRV} = NOAEL or LOAEL-based screening level (mg chemical/kg soil)
ADD = NOAEL or LOAEL (mg COPC/kg body weight-day)
BW = Average Body Weight of the receptor (kg)
IR_{food} = Average Ingestion Rate of food (kg food ingested per day, dry weight)
BAF_{food} = BAF of dietary component used, specific to prey type and COPC (ratio of mg of COPEC/kg fauna, wet weight to mg COPEC/ kg substrate, dry weight)
DF = Dietary Fraction
IR_s = Average Incidental Ingestion Rate of soil (kg substrate ingested per day, dry weight)
$AF_{refined}$ = Refined Area Use Factor (detailed below)

The refined exposure estimates and ecological effects are developed for wildlife receptors having complete exposure pathways to be quantitatively evaluated (i.e., omnivorous birds, and carnivorous and herbivorous mammals). In the refined model, an average body weight, average ingestion rate, and a 95% UCL as the EPC are used. Refined receptor-specific exposure parameters are presented on Table F.2-9 (Appendix F.2). In addition, a realistic area use factor ($AF_{refined}$) was calculated as the ratio of the site area to the average home range of the receptor which is also presented in Table F.2-9 (Appendix F.2). A summary of the results of the refined exposure assessment for terrestrial wildlife is provided below.

Terrestrial Wildlife

The refined risk characterization results are presented in Table F.2-24 and summarized below for each of the receptors with chemical HQs greater than 1:

Receptor	NOAEL Only HQ>1	NOAEL and LOAEL HQ>1
Meadow Vole	none	none
Short-tailed Shrew	lead (1.8), 2,3,7,8-TCDD TEQ (2.5)	none
Red Fox	none	none
American Robin	chromium (1.2), zinc (6.0), 2,4-DNT (1.1), 2,6-DNT (2.5), 2,4,6-TNT (7.1)	lead (19/1.9)
Red-tailed Hawk	none	none

*Note: (1.8) = NOAEL-based HQ
(19/1.9) = NOAEL-based HQ/LOAEL-based HQ

7.7 RISK MANAGEMENT – SCIENTIFIC MANAGEMENT DECISION POINT

The findings of the ecological risk screen including site characterization and risk calculations are used as input to risk management decision-making for the site. The SMDP reached from the ecological risk screening concludes that one of the following statements is true:

- There is adequate information to conclude that ecological risks are not significant and therefore there is no need for further action at the site on the basis of ecological risk;
- The information is not adequate to make a decision at this point and further refinement of data is needed to augment the ecological risk screening; or
- The information collected and presented indicates that a more thorough assessment is warranted.

Terrestrial plant COPECs with refined HQs greater than 1 included: aluminum (HQ=370), chromium (HQ=29), copper (HQ=1.5), lead (HQ=6), manganese (HQ=5.6), selenium (HQ=1.1), thallium (HQ=1.5), vanadium (HQ=17), and zinc (HQ=4.2). Although the refined aluminum HQ is greater than 1, the average pH in the surface soil is greater than 5.5 (see Appendix C.1). Therefore, since aluminum is biologically inactive in circumneutral to alkaline conditions (pH 5.5-8.0) such as those present at the site, aluminum is not considered a COPEC (USEPA 2003). Chromium, manganese, thallium, and vanadium are below background; therefore, these chemicals are not considered site-related. A discussion of the methodology of site versus background comparison is provided in Section 6.4.2. Even though the refined HQs for copper (1.5), lead (6.0), selenium (1.1), and zinc (4.2) are greater than 1, these HQs present low risk to terrestrial plants at the site. In addition although metals concentrations in plants were above the screening levels, indications of chemical vegetative stress were not observed at the site.

Soil invertebrates and microbial processes COPECs with refined HQs greater than 1 included chromium (HQ=73), copper (HQ=1.3), iron (HQ=190), manganese (HQ=2.8), vanadium (HQ=1.7), and zinc (HQ=5.6). Chromium, manganese and vanadium are below background; therefore, these chemicals are not considered site-related. A discussion of the methodology of site versus background comparison is provided in Section 6.4.2. Even though the refined HQs for copper (1.3) and zinc (5.6) are greater than 1, these presents low risk to invertebrates and microbial processes at the site. In addition although the iron HQ is greater than 1, since only one surface soil sample exceeded iron's background point estimate for the site indicating iron concentrations at the site are not considered significantly above background, iron is not considered a COPEC at the site.

The refined risk characterization for wildlife resulted in the identification of lead (HQ=1.9) with a LOAEL-based HQ greater than 1 for the American robin. Even though the refined HQ for lead (1.9) is greater than 1, this presents low risk to the American robin.

After consideration of the limited metals concentrations above ecological screening levels, the spatial distribution of data at the site (see Section 4.0), and background, the SMDP is the following:

There is adequate information to conclude that ecological risks are not significant and therefore there is no need for further action at the site on the basis of ecological risk.

7.8 EXPOSURE AND RISK UNCERTAINTY ANALYSIS

Based on this assessment, while factors such as lack of TSV and wildlife profile assumptions may create limited uncertainty, the overall result of the conservative nature of the process has produced a conservative assessment of potential ecological risks associated with the site.

Assumptions and other factors that tend to overestimate, underestimate, or have an unknown effect on the findings of the ecological risk screening are presented below with a discussion of their uncertainty.

7.8.1 Data Quality

Insufficient sampling density or the analyte list may not provide a representative estimate of exposure to COPECs. Misrepresentation of exposure results in uncertainty and may lead to an overestimation or underestimation of risk. Ten or more sampling locations at the site under consideration reduce this uncertainty. Moreover, the extensive list of constituents analyzed reduces the likelihood of failing to identify a COPEC. Therefore, the uncertainty in the ecological risk screening results associated with data quality is likely minimal.

7.8.2 COPEC Bioavailability

Chemical analyses of exposure media measured the total levels of the COPECs rather than the more bioavailable toxic forms. The availability of the total concentrations alone assumes that the entire fraction is bioavailable and toxic. This is likely to be a very conservative assumption that varies from constituent to constituent. It was also assumed that no geochemical factors limited receptor exposure to, or the

potential for toxic expression of COPECs. It is likely that COPECs may, to some degree, adsorb to fine-grained particles and/or complex with chemical complexing agents and organic ligands in the exposure media. Such actions may change the chemical speciation of the COPECs to a less toxic form, or reduce the concentrations of bioavailable chemicals and subsequent uptake by receptors. Therefore, risk is likely to be overestimated.

7.8.3 Wildlife Profile Assumptions

Dose rate models require a number of assumptions, which could result in either an overestimation or underestimation of risk to receptors. For example, body weights and ingestion rates are estimated from limited information. In addition, receptors are assumed to feed on specified food sources, although some such as the Red Fox may feed opportunistically on a greater variety of food types.

AFs were estimated based on the size of the site relative to the home ranges of the receptors. However, the foraging of birds and mammals is not assessed simply by size, but rather a function of habitat suitability, habitat productivity, and species-specific foraging behaviors. Therefore, because habitat quality is not accounted for in estimating AF, the risk to terrestrial receptors in this assessment is likely to be overestimated.

The qualitative nature of the conclusion of lack of risk to the plant community based on the lack of indicator of chemical vegetative stress and lush vegetation present at the site creates uncertainty since it is not known that if the local plant community shows a response in terms of lower species diversity, reduced growth, or other more subtle responses that might be observable when compared to an unimpacted reference location.

7.8.4 Lack of Toxicological Data

The evaluation of ecological effects was limited in the direct contact and wildlife ingestion pathways due to limited toxicological data of the COPECs. The effects of many COPECs evaluated for the direct contact pathway to invertebrates and microbial communities were not quantified due to the lack of invertebrate derived TRVs. In addition, NOAEL and LOAEL TRVs were not available for receptors exposed to multiple COPECs. Therefore, due to the lack of toxicological data, the risk to potential receptors may be underestimated or unknown.

7.8.5 TRVs

NOAEL and LOAEL TRVs identified for wildlife receptors represent the most conservative application of toxicity test results identified from the literature. High uncertainty factors were used to provide TRVs representative of chronic exposure and sub-lethal effects. This approach is likely to overestimate the sensitivity of many ecological receptors and likely overestimates risk to potential receptors.

7.8.6 Hazard Quotients

Uncertainties in characterizing risks are primarily associated with the assumption that an HQ greater than 1 is an adequate indicator of the potential for ecological risks of individual chemicals. Given the use of conservative and realistic exposure and effects assumptions previously discussed, there is minimal uncertainty that the potential for ecological risks of individual chemicals are not identified in the ecological risk screening of the site. Conversely, there is a strong possibility for false positive identification of ecological risks for some individual chemicals.

An HQ of less than one indicates that the contaminant alone is unlikely to cause adverse ecological effects. The potential for risk increases as the HQ increases above one. However, this result should be considered in the context of other characteristic of the exposure area. In addition, it should be noted that the calculation of chemical specific HQs does not account for multiple chemicals acting through the same exposure mechanism.

7.8.7 Exposure and Risk Uncertainty Conclusions

While factors such as lack of TRV and wildlife profile assumptions may create limited uncertainty, these limited uncertainties have produced a conservative assessment of potential ecological risks associated with the RFI study area.

8.0 CONCLUSIONS AND RECOMMENDATION FOR FUTURE ACTION

An RFI has been completed for SWMU 13, which consists of an approximate 1.6 acre area located outside the current operational area of the OBG between the OBG perimeter berm and the New River. The purpose of the RFI was to evaluate potential releases to soil within the RFI study area from historical operations at the OBG. Groundwater at the OBG and below the RFI study area is being monitored and addressed separately from this RFI under the RCRA Subpart X Permit with the VDEQ.

Soil sampling with the RFI study area indicated that lead was the primary COPC based on limited detections of lead above R-RSL of 400 mg/kg (21 of 183 samples) and I-RSL of 800 mg/kg (6 of 183 samples). Most of the detections of lead above RSL were in samples collected adjacent or proximate to OBG perimeter berm at isolated locations. Approximately 40% of these detections were closest to OBG Burning Pad 6. Other COPCs that were identified in soil included antimony, iron, thallium, four high molecular weight PAHs, and nitroglycerin. Groundwater monitoring conducted within the OBG adjacent to the perimeter berm has not indicated leaching of lead or other site COPCs from soil to groundwater at detectable levels. As presented in Section 4.4, based on the limited extent of chemicals in soil within the study area above RSLs, the low lying, lush vegetation present at the site (see photo log in Appendix A), and the percentage of ground cover (90%), the potential for RFI study area related releases from soil to the New River via runoff at levels of concern is not considered significant.

A HHRA was performed to evaluate the potential human health effects associated with releases to soil in the RFI study area. Receptors evaluated included: current/future maintenance worker, current/future adolescent trespasser, hypothetical future construction worker, hypothetical future commercial worker, hypothetical future adult resident, hypothetical future child resident, and hypothetical future lifetime resident. Total carcinogenic risk calculated for each receptor was below or within USEPA's target risk range for Superfund sites (1E-06 to 1E-04, USEPA 1989). The results of the lead modeling predicted the probability of the receptors expected to have blood levels of 10 μg/dL or greater were below the established threshold of 5%. Total non carcinogenic hazards after target organ segregation and consideration of background for all receptors were equal to or below the USEPA reference HI of 1E+00. The results of the human health risk assessment did not indicate a requirement for further action for soil in the RFI study area.

A SLERA was performed to evaluate potential ecological risk associated with soil in the RFI study area. Receptors evaluated included soil invertebrates and microbes, plants, and terrestrial wildlife. The results of the screening level ecological risk assessment indicated there is adequate information to conclude that ecological risks were not significant at the RFI study area, and therefore, there was no need for further action for soil at the RFI study area on the basis of ecological risk.

Based on the results of the RFI, HHRA, and SLERA, no further action beyond the implementation of institutional controls to prevent future digging at the RFI study area is recommended. ICs are being implemented at the RFI study area at SWMU 13 within the boundaries depicted on Figure 1-2. The objective of the ICs is to prevent future digging at the site. Specifically this site has been incorporated into plant management manual to ensure long-term protection of human health and the environment. The management manual provides for advance notice, assessment and approval of intrusive work that may occur within the plant with a general digging prohibition at sites such as this. In the event the property is transferred or leased, equivalent ICs will be put into terms and conditions of the deed or lease, which are no less restrictive than the IC objectives described above. Furthermore, the transferee or lessee will be responsible for ensuring IC compliance by any future users. However, the Army acknowledges the responsibility for all original liability under CERCLA and its right and responsibility to enforce ICs.

STANDARD OPERATING PROCEDURE 10.1
FIELD LOGBOOK

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for recording daily site investigation activities.

Records should contain sufficient information so that anyone can reconstruct the sampling activity without relying on the collector's memory.

2.0 MATERIALS

- Field Logbook;
- Indelible ink pen; and
- Clear tape.

3.0 PROCEDURE

Information pertinent to site investigations will be recorded in a bound logbook. Each page/form will be consecutively numbered, dated, and signed. All entries will be made in indelible ink, and all corrections will consist of line out deletions that are initialed and dated. If only part of a page is used, the remainder of the page should have an "X" drawn across it. At a minimum, entries in the logbook will include but not be limited to the following:

- Project name (cover);
- Name and affiliation of personnel on site;
- Weather conditions;
- General description of the field activity;
- Sample location;
- Sample identification number;
- Time and date of sample collection;
- Specific sample attributes (e.g., sample collection depth flow conditions or matrix);
- Sampling methodology (grab or composite sample);
- Sample preservation, as applicable;
- Analytical request/methods;
- Associated quality assurance/quality control (QA/QC) samples;
- Field measurements/observations, as applicable; and
- Signature and date of personnel responsible for documentation.

4.0 MAINTENANCE

Not applicable.

5.0 PRECAUTIONS

None.

STANDARD OPERATING PROCEDURE 10.2
SURFACE WATER, GROUNDWATER, AND SOIL/SEDIMENT FIELD LOGBOOKS

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for recording surface water, groundwater, and soil/sediment sampling information, as well as instrument calibration data in field logbooks.

2.0 MATERIAL

- Applicable field logbook (see attached forms); and
- Indelible ink pen.

3.0 PROCEDURE

All information pertinent to surface water, groundwater, or soil/sediment sampling will be recorded in the appropriate logbook. Each page/form of the logbook will be consecutively numbered. All entries will be made with an indelible ink pen. All corrections will consist of line out deletions that are initialed and dated.

3.1 SOIL/SEDIMENT

3.1.1 Field Parameters/Logbook (Form 10.2-a)

1. HIGH CONCENTRATION EXPECTED?: Answer "Yes" or "No.";
2. HIGH HAZARD?: Answer "Yes" or "No.";
3. INSTALLATION/SITE: Record the complete name of the installation or site;
4. AREA: Record the area designation of the sample site;
5. INST. NAME: Record the two-letter installation name for Radford Army Ammunition Plant – "RD";
6. SAMPLE MATRIX CODE: Record the appropriate sample matrix code. Common codes are "SD" for solid - sediment, "SI" for soil - gas, "SL for solid sludge, "SO" for surface other, "SS" for solid – soil, "SW" for surface wipe, "WD" for water – potable, "WG" for water – ground, "WS" water – surface, "WT" – water treated and "WW" water -waste;
7. SITE ID: Record a code up to 20 characters or numbers that is unique to the site;
8. ENV. FIELD SAMPLE IDENTIFIER: Record a code up to 20 characters specific for the sample;
9. DATE: Enter the date the sample was taken;
10. TIME: Enter the time (12-hour or 24-hour clock acceptable as long as internally consistent) the sample was taken;
11. AM PM: Circle "AM" or "PM" to designate morning or afternoon (12-hour clock);
12. SAMPLE PROG: Record "RFI" (RCRA Facility Investigation) or other appropriate sample program;
13. DEPTH (TOP): Record the total depth sampled;
14. DEPTH INTERVAL: Record the intervals at which the plug will be sampled;

15. UNITS: Record the units of depth (feet, meters);
16. SAMPLE MEASUREMENTS: Check the appropriate sampling method;
17. CHK: Check off each container released to a laboratory;
18. ANALYSIS: Record the type of analysis to be performed on each sample container;
19. SAMPLE CONTAINER: Record the sample container type and size;
20. NO.: Record the number of containers;
21. REMARKS: Record any remarks about the sample;
22. TOTAL NUMBER OF CONTAINERS FOR SAMPLE: Record the total number of containers;
23. SITE DESCRIPTION: Describe the location where the sample was collected;
24. SAMPLE FORM: Record the form of the sample (i.e., clay, loam, etc.) using The Unified Soil Classification System (USCS);
25. COLOR: Record the color of the sample as determined from standard Munsell Color Charts;
26. ODOR: Record the odor of the sample or "none";
27. PID: Record the measured PID values or other similar measurement instrument value;
28. UNUSUAL FEATURES: Record anything unusual about the site or sample;
29. WEATHER/TEMPERATURE: Record the weather and temperature; and
30. SAMPLER: Record your name.

3.1.2 Map File Form (refer to form 10.2-c)

1. SITE ID: Record the Site ID from the field parameter form;
2. POINTER: Record the field sample number for the sample being pointed to;
3. DESCRIPTION/MEASUREMENTS: Describe the location where the sample was taken, along with distances to landmarks;
4. SKETCH/DIMENSIONS: Diagram the surroundings and record the distances to landmarks;
5. MAP REFERENCE: Record which U.S.G.S. Quad Map references the site;
6. COORDINATE DEFINITION: Write the compass directions and the X- and Y-coordinates of the map run;
7. COORDINATE SYSTEM: Write "UTM" (Universal Transverse Mercator);
8. SOURCE: Record the 1-digit code representing the Map Reference;
9. ACCURACY: Give units (e.g., write "1-M" for 1 meter);
10. X-COORDINATE: Record the X-coordinate of the sample site location;
11. Y-COORDINATE: Record the Y-coordinate of the sample site location;
12. UNITS: Record the units used to measure the map sections;
13. ELEVATION REFERENCE: Record whether topography was determined from a map or a topographical survey;
14. ELEVATION SOURCE: Record the 1-digit code representing the elevation reference;

15. ACCURACY: Record the accuracy of the map or survey providing the topographical information;
16. ELEVATION: Record the elevation of the sampling site;
17. UNITS: Write the units in which the elevation is recorded; and
18. SAMPLER: Write your name.

3.2 SURFACE WATER

3.2.1 Field Parameter Logbook (Forms 10.2-b and 10.2-c)

1. CAL REF: Record the calibration reference for the pH meter;
2. pH: Record the pH of the sample;
3. TEMP: Record the temperature of the sample in degrees Celsius;
4. COND: Record the conductivity of the water;
5. Description of site and sample conditions (refer to 10.2-b);
6. Map File Form (refer to Section 3.1.2).

3.3 GROUNDWATER (FORMS 10.2- D)

3.3.1 Field Parameter Logbook (Form 10.2.b)

Refer to Section 3.2.1.

3.3.2 Map File and Purging Forms

1. WELL NO. OR ID: Record the abbreviation appropriate for where the sample was taken. Correct abbreviations can be found on pages 18-21 of the IRDMIS User's Guide for chemical data entry;
2. SAMPLE NO.: Record the reference number of the sample;
3. WELL/SITE DESCRIPTION: Describe the location where the sample was taken, along with distances to landmarks;
4. X-COORD AND Y-COORD: Record the survey coordinates for the sampling site;
5. ELEV: Record the elevation where the sample was taken;
6. UNITS: Record the units the elevation was recorded in;
7. DATE: Record the date in the form MM/DD/YY;
8. TIME: Record the time, including a designation of AM or PM;
9. AIR TEMP.: Record the air temperature, including a designation of C or F (Celsius or Fahrenheit);
10. WELL DEPTH: Record the depth of the well in feet and inches;
11. CASING HEIGHT: Record the height of the casing in feet and inches;
12. WATER DEPTH: Record the depth (underground) of the water in feet and inches;
13. WELL DIAMETER: Record the diameter of the well in inches;
14. WATER COLUMN HEIGHT: Record the height of the water column in feet and inches;
15. SANDPACK DIAM.: Record the diameter of the sandpack. Generally, this will be the same as the bore diameter;

16. EQUIVALENT VOLUME OF STANDING WATER: Use one of the following equations to determine one equivalent volume (EV);

    1 EV = volume in casing + volume in saturated sandpack. Or:

    $1\ EV = [\pi R_w^2 h_w + 0.30p(R_s^2 - R_w^2)h_s] * (0.0043)$

Where:

R_s = radius of sandpack in inches
R_w = radius of well casing in inches
h_s = height of sandpack in inches
h_w = water depth in inches

$0.0043 = gal/in^3$

and filter pack porosity is assumed as 30%, or

Volume in casing =
$(0.0043\ gal/in^3)(p)(12\ in/ft)(R_c^2)(W_h)$

Where:

R_c = radius of casing in inches, and
W_h = water column height in feet

Vol. in sandpack =
(0.0043 gal/in3)(p)(12 in/ft)(Rb2 - Rc2)(Wh)(0.30)

(if Wh is less than the length of the sandpack), or

Vol. in sandpack =
(0.0043 gal/in3)(p)(12 in/ft)(Rb2 - Rc2)(Sh)(0.30)

(if Wh is greater than the length of the sandpack).

where:

Rb = radius of the borehole, and
Sh = length of the sandpack.

Show this calculation in the comments section.

1. PUMP RATE: Record pump rate;
2. TOTAL PUMP TIME: Record total purge time and volume;
3. WELL WENT DRY? Write “YES” or “NO”;
4. PUMP TIME: Record pump time that made the well go dry;
5. VOLUME REMOVED: Record the volume of water (gal) removed before the well went dry;
6. RECOVERY TIME: Record the time required for the well to refill;
7. PURGE AGAIN?: Answer “YES” or “NO”;
8. TOTAL VOL. REMOVED: Record the total volume of water (in gallons) removed from the well;

9. CAL REF.: Record the calibration reference for the pH meter;
10. TIME: Record time started (INITIAL T(0)), 2 times DURING the sampling and the time sampling ended (FINAL);
11. pH: Record the pH at start of sampling (INITIAL), twice DURING the sampling, and at the end of sampling (FINAL);
12. TEMP: Record the water temperature (Celsius) at the start of sampling, twice DURING the sampling, and at the end of sampling (FINAL);
13. COND: Record the conductivity of the water at the start of sampling, twice DURING the sampling, and at the end of sampling (FINAL);
14. D.O.: Record the dissolved oxygen level in the water at the start of sampling, twice DURING the sampling, and at the end of sampling (FINAL);
15. TURBIDITY: Record the readings from the turbidity meter (nephelometer) and units at the start of sampling, twice DURING the sampling, and at the end of sampling (FINAL);
16. ORD: Record the oxidation/reduction (RedOx) potential of the water sample at the start of sampling, twice DURING the sampling, and at the end of sampling (FINAL);
17. HEAD SPACE: Record any positive readings from organic vapor meter reading taken in well headspace before sampling;
18. NAPL: Record the presence and thickness of any non-aqueous phase liquids (LNAPL and DNAPL)
19. COMMENTS: Record any pertinent information not already covered in the form; and
20. SIGNATURE: Sign the form.

3.4 FIELD CALIBRATION FORMS (REFER TO FORM 10.2-E)

1. Record time and date of calibration;
2. Record calibration standard reference number;
3. Record meter ID number;
4. Record initial instrument reading, recalibration reading (if necessary), and final calibration reading on appropriate line;
5. Record value of reference standard (as required);
6. COMMENTS: Record any pertinent information not already covered on form; and
7. SIGNATURE: Sign form.

STANDARD OPERATING PROCEDURE 10.3
BORING LOGS

1.0 INTRODUCTION

The purpose of this standard operating procedure (SOP) is to describe the methods to be followed for classifying soil and rock, as well as preparing borehole logs and other types of soil reports.

2.0 MATERIALS

The following equipment is required for borehole logging:

- HTRW ENG Form 5056-R and 5056A-R boring log forms;
- Daily inspection report forms;
- Chain-of-custody forms;
- Request for analysis forms;
- ASTM D 2488 classification flow chart;
- Soil and/or Rock color chart (i.e., Munsell®);
- Grain size and roundness chart;
- Graph paper;
- Engineer's scale;
- Previous reports and boring logs;
- Pocketknife or putty knife;
- Hand lens;
- Dilute hydrochloric acid (10% volume);
- Gloves;
- Personal protective clothing and equipment, as described in work plan addenda health and safety plan;
- Photoionization detector or other appropriate monitoring equipment per site-specific health and safety plan; and
- Decontamination supplies (SOP 80.1).

3.0 PROCEDURE

Each boring log should fully describe the subsurface environment and the procedures used to obtain this description.

Boring logs should be prepared in the field on USACE Engineer Form 5056-R and 5056-R. Logs should be recorded in the field directly on the boring log form and not transcribed from a field book.

A “site geologist” should conduct borehole logging and soil/rock identification and description or other professional trained in the identification and description of soil/rock.

3.1 BORING LOG INFORMATION

As appropriate, the following information should be recorded on the boring log during the course of drilling and sampling activities:

- Project information including name, location, and project number;
- Each boring and well should be uniquely numbered and located on a sketch map as part of the log;
- Type of exploration;
- Weather conditions including events that could affect subsurface conditions;
- Dates and times for the start and completion of borings, with notations by depth for crew shifts and individual days;
- Depths/heights in feet and in decimal fractions of feet;
- Descriptions of the drilling equipment including rod size, bit type, pump type, rig manufacturer and model, and drilling personnel;
- Drilling sequence and descriptions of casing and method of installation;
- Description and identification of soils in accordance with ASTM Standard D 2488;
- Descriptions of each intact soil sample for the parameters identified in Section 3.2;
- Descriptions and classification of each non-intact sample (e.g., wash samples, cuttings, auger flight samples) to the extent practicable;
- Description and identification of rock;
- Description of rock (core(s)) for the parameters identified in Section 3.7;
- Scaled graphic sketch of the rock core (included or attached to log) according to the requirements identified in Section 3.7;
- Lithologic boundaries, with notations for estimated boundaries;
- Depth of water first encountered in drilling, with the method of first determination (any distinct water level(s) below the first zone will also be noted);
- Interval by depth for each sample taken, classified, and/or retained, with length of sample recovery and sample type and size (diameter and length);
- Blow counts, hammer weight, and length of fall for driven samplers;
- Rate of rock coring and associated rock quality designation (RQD) for intervals cored;
- Drilling fluid pressures, with driller’s comments;
- Total depth of drilling and sampling;
- Drilling fluid losses and gains should be recorded;
- Significant color changes in the drilling fluid returned;
- Soil gas or vapor readings with the interval sampled, with information on instrument used and calibration;

- Depth and description of any in-situ test performed; and
- Description of other field tests conducted on soil and rock samples.

3.2 SOIL PARAMETERS FOR LOGGING

In general, the following soil parameters should be included on the boring log when appropriate:

- Identification per ASTM D 2488 with group symbol;
- Secondary components with estimated percentages per ASTM D 2488;
- Color;
- Plasticity per ASTM D 2488;
- Density of non-cohesive soil or consistency of cohesive soil;
- Moisture condition per ASTM D 2488 (dry, moist, or wet);
- Presence of organic material;
- Cementation and HCL reaction testing per ASTM D 2488;
- Coarse-grained particle description per ASTM D 2488 including angularity, shapes, and color;
- Structure per ASTM D 2488 and orientation;
- Odor; and
- Depositional environment and formation, if known.

ASTM D 2488 categorizes soils into 13 basic groups with distinct geologic and engineering properties based on visual-manual identification procedures. The following steps are required to classify a soil sample:

1. Observe basic properties and characteristics of the soil. These include grain size grading and distribution, and influence of moisture on fine-grained soil.
2. Assign the soil an ASTM D 2488 classification and denote it by the standard group name and symbol.
3. Provide a written description to differentiate between soils in the same group if necessary.

Many soils have characteristics that are not clearly associated with a specific soil group. These soils might be near the borderline between groups, based on particle distribution or plasticity characteristics. In such a case, assigning dual group names and symbols (e.g., GW/GC or ML/CL) might be an appropriate method of describing the soil. The two general types of soils, for which classification is performed, coarse- and fine-grained soils, are discussed in the following sections.

3.3 COURSE-GRAINED SOIL IDENTIFICATION

For soils in the coarse-grained soils group, more than half of the material in the soil matrix will be retained by a No. 200 sieve (75-μm).

1. Coarse-grained soils are identified on the basis of the following:
   a) Grain size and distribution;
   b) Quantity of fine-grained material (i.e., silt and clay as a percentage); and
   c) Character of fine-grained material.

2. The following symbols are used for classification:

Basic Symbols			Modifying Symbols
G	=	gravel	W = well graded
S	=	sand	P = poorly graded
			M = with silty fines
			C = with clayey fines

3. The following basic facts apply to coarse-grained soil classification.

- The basic symbol G is used if the estimated percentage of gravel is greater than that for sand. In contrast, the symbol S is used when the estimated percentage of sand is greater than the percentage of gravel.
- Gravel ranges in size from 3-inch to 1/4-inch (No. 4 sieve) diameter. Sand ranges in size from the No. 4 sieve to No. 200 sieve. The Grain Size Scale used by Engineers (ASTM Standard D 422-63) is the appropriate method to further classify grain size as specified by ASTM D 2488.
- Modifying symbol W indicates good representation of all particle sizes.
- Modifying symbol P indicates that there is an excess or absence of particular sizes.
- The symbol W or P is used only when there are less than 15% fines in a sample.
- Modifying symbol M is used if fines have little or no plasticity (silty).
- Modifying symbol C is used if fines have low to high plasticity (clayey).

Figure 10.03a is a flowchart for identifying coarse-grained soils by ASTM D 2488.

3.4 FINED-GRAINED SOIL IDENTIFICATON

If one-half or more of the material will pass a No. 200 sieve (75 μm), the soil is identified as fine-grained.

1. Fine-grained soils are classified based on dry strength, dilatancy, toughness, and plasticity.
2. Classification of fine-grained soils uses the following symbols:

Basic Symbols			Modifying Symbols		
M	=	silt (non plastic)	L	=	low liquid limit (lean)
C	=	clay (plastic)	H	=	high liquid limit (fat)
O	=	organic			
Pt	=	peat			

3. The following basic facts apply to fine-grained soil classification:
    - The basic symbol M is used if the soil is mostly silt, while the symbol C applies if it consists mostly of clay.
4. Use of symbol O (group name OL/OH) indicates that organic matter is present in an amount sufficient to influence soil properties. The symbol Pt indicates soil that consists mostly of organic material.

- Modifying symbols (L and H) are based on the following hand tests conducted on a soil sample:
    — Dry strength (crushing resistance).
    — Dilatancy (reaction to shaking).

— Toughness (consistency near plastic limit).

- Soil designated ML has little or no plasticity and can be recognized by slight dry strength, quick dilatency, and slight toughness.
- CL indicates soil with slight to medium plasticity, which can be recognized by medium to high dry strength, very slow dilatancy, and medium toughness.

Criteria for describing dry strength per ASTM D 2488 are as follows:

Description	Criteria
None	Dry sample crumbles into powder with pressure of handling
Low	Dry specimen crumbles into powder with some finger pressure
Medium	Dry specimen breaks into pieces or crumbles with considerable finger pressure
High	Dry specimen cannot be broken with finger pressure but will break into pieces between thumb and a hard surface
Very high	Dry specimen cannot be broken between the thumb and a hard surface stiffness

Criteria for describing dilatancy per ASTM D 2488 are as follows:

None	No visible change in the sample
Slow	Water appears slow on the surface of the sample during shaking and does not disappear or disappears slowly upon squeezing
Rapid	Water appears quickly on the surface of the sample during shaking and disappears quickly upon squeezing

Criteria for describing toughness per ASTM D 2488 are as follows:

Description	Criteria
Low	Only slight pressure is required to roll the thread near the plastic limit and the thread and lump are weak and soft
Medium	Medium pressure is required to roll the thread to near the plastic limit and the thread and lump have medium stiffness
High	Considerable pressure is required to roll the thread to near the plastic limit and the thread and lump have very high stiffness

Figure 10.03b is a flowchart for identifying fine-grained soils by ASTM D 2488.

3.5 DENSITY AND CONSISTENCY

Relative density for coarse-grained soils and consistency for fine-grained soils can be estimated using standard penetration test blow count data (ASTM D 1586). The number of blows required for each 6 inches of penetration or fraction thereof is recorded. If the sampler is driven less than 18 inches, the number of blows per each complete 6-inch interval and per partial interval is recorded.

For partial increments, the depth of penetration should be recorded to the nearest 1 inch. If the sampler advances below the bottom of the boring under the weight of rods (static) and/or hammer, then this information should be recorded on the log.

The following are some "rule-of-thumb" guidelines for describing the relative density of coarse-grained soils:

Blow Count	Relative Density for Sand
0–4	Very loose
4–10	Loose
10–30	Medium dense
30–50	Dense
>50	Very Dense

The following are some "rule-of-thumb" guidelines for describing the consistency of fine-grained soils:

Blow Count	Consistency for Clays	Description
0–2	Very Soft	Sample sags or slumps under its own weight
2–4	Soft	Sample can be pinched in two between the thumb and forefinger
4–8	Medium Stiff	Sample can be easily imprinted with fingers
8–16	Stiff	Sample can be imprinted only with considerable pressure of fingers
16–32	Very Stiff	Sample can be imprinted very slightly with fingers
>32	Hard	Sample cannot be imprinted with fingers; can be pierced with pencil

3.6 OTHER DESCRIPTIVE INFORMATION

The approximate percentage of gravel, sand, and fines (use a percentage estimation chart) should be recorded per ASTM D 2488 as follows:

Modifiers	Descriptions
Trace	Less than 5%
Few	5%–10%
Little	15%–25%
Some	30%–45%
Mostly	50%–100%

Color/discoloration should be recorded and described using a soil color chart, such as the Munsell® Soil Color Charts. A narrative and numerical description should be given from the color chart, such as Brown 10 YR, 5/3 (Munsell®). Odor should be described if organic or unusual.

Plasticity should be described as follows:

Description	Criteria
Non-plastic	A 1/8-inch thread cannot be rolled at any water content
Low	Thread can barely be rolled and lump cannot be formed when drier than plastic limit.
Medium	Thread is easy to roll; plastic limit can be reached with little effort and lump crumbles when drier than plastic limit.
High	Considerable time is required to reach the plastic limit and lump can be formed without crumbling when drier than plastic limit.

Moisture condition should be recorded as dry (absence of moisture), moist (damp but no visible water) or wet (visible free water).

Cementation should be recorded (carbonates or silicates) along with the results of HCL reaction testing. The reaction with HCL should be described as none (no visible reaction), weak (some reaction with slowly forming bubbles) or strong (violent reaction with bubbles forming immediately).

Particle description information for coarse-grained soil should be recorded where appropriate per ASTM D 2488 including maximum particle size, angularity (angular, subangular, subrounded, or rounded), shape (flat, elongated or flat and elongated), and color.

Structure (along with orientation) should be reported using the following ASTM D 2488 descriptions:

Description	Criteria
Stratified	Alternating layers of varying material or color with layers greater than 6 millimeters thick
Laminated	Alternating layers of varying material or color with layers less than 6 millimeters thick
Fissured	Breaks along definite planes of fracture with little resistance
Slickensided	Fracture planes that appear polished or glossy, can be striated
Blocky	Inclusion of small pockets of different soils
Homogeneous	Same color and appearance throughout

3.7 ROCK CORE PARAMETERS FOR LOGGING

In general, the following parameters should be included on the boring log when rock coring is conducted:

- Rock type;
- Formation;
- Modifier denoting variety;
- Bedding/banding characteristics;
- Color;
- Hardness;
- Degree of cementation;
- Texture;
- Structure and orientation;
- Degree of weathering;
- Solution or void conditions;
- Primary and secondary permeability including estimates and rationale; and
- Lost core interval and reason for loss.

A scaled graphic sketch of the core should provided on or attached to the log, denoting by depth, location, orientation, and nature (natural, coring-induced, or for fitting into core box) of all core breaks. Where fractures are too numerous to be shown individually, their location may be drawn as a zone.

The RQD values for each core interval (run) should be calculated and included on the boring log. The method of calculating the RQD is as follows per ASTM D 6032:

RQD = [Σ length of intact core pieces > 100 mm (4-inches)] x 100%/total core length.

3.8 PROCEDURES FOR ROCK CLASSIFICATION

For rock classification record mineralogy, texture, and structural features (e.g., biotite and quartz fine grains, foliated parallel to relict bedding oriented 15 to 20 degrees to core axis, joints coated with iron oxide). Describe the physical characteristics of the rock that are important for engineering considerations such as fracturing (including minimum, maximum, and most common and degree of spacing), hardness, and weathering.

1. The following is to be used as a guide for assessing fracturing:

AEG Fracturing	Spacing
Crushed	up to 0.1 foot
Intense	0.1–0.5 foot
Moderate	0.5 foot–10 feet
Slight	1.0 foot–3.0 feet
Massive	>3.0 feet

2. Record hardness using the following guidelines:

Hardness	Criteria
Soft	Reserved for plastic material
Friable	Easily crumbled by finger pressure
Low	Deeply gouged or carved with pocketknife
Moderate	Readily scratched with knife; scratch leaves heavy trace of dust
Hard	Difficult to scratch with knife; scratch produces little powder and is often faintly visible
Very Hard	Cannot be scratched with knife

3. Describe weathering using the following guidelines:

Weathering	**Decomposition**	**Discoloration**	**Fracture Condition**
Deep	Moderate to complete alteration of minerals feldspars altered to clay, etc.	Deep and thorough	All fractures extensively coated with oxides, carbonates, or clay
Moderate	Slight alteration of minerals, cleavage surface lusterless and stained	Moderate or localized and intense	Thin coatings or stains
Weak	No megascopic alteration of minerals	Slight and intermittent and localized	Few strains on fracture surfaces
Fresh	Unaltered, cleavage, surface glistening		

3.9 PROCEDURE FOR LOGGING REFUSE

The following procedure applies to the logging of subsurface samples composed of various materials in addition to soil as may be collected from a landfill or other waste disposal site.

1. Observe refuse as it is brought up by the hollow stem auger, bucket auger, or backhoe.
2. If necessary, place the refuse in a plastic bag to examine the sample.
3. Record observations according to the following criteria:

- Composition (by relative volume), e.g., paper, wood, plastic, cloth, cement, or construction debris. Use such terms as "mostly" or "at least half." Do not use percentages;
- Moisture condition: dry, moist, or wet;
- State of decomposition: highly decomposed, moderately decomposed, slightly decomposed, etc.;
- Color: obvious mottling and/or degree of mottling;
- Texture: spongy, plastic (cohesive), friable;
- Odor;
- Combustible gas readings (measure down hole and at surface); and
- Miscellaneous: dates of periodicals and newspapers, ability to read printed materials, degree of drilling effort (easy, difficult, and very difficult).

3.10 SUBMITTAL REQUIREMENTS

Each original boring log should be submitted to the Contracting Officer Representative (CRO) after completion of the boring. When a monitoring well will be installed in a boring, the boring log and well installation diagram should be submitted together.

4.0 MAINTENANCE

STANDARD OPERATING PROCEDURE 10.4
CHAIN-OF-CUSTODY FORM

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for use of the chain-of-custody form. An example is provided as part of this SOP. Other formats with similar levels of detail are acceptable.

2.0 MATERIALS

- Chain-of-custody form; and
- Indelible ink pen.

3.0 PROCEDURE

1. Record the project name and number.
2. Record the project contact's name and phone number.
3. Print sampler's names in "Samplers" block.
4. Enter the Field Sample No.
5. Record the sampling dates for all samples.
6. List the sampling times (military format) for all samples.
7. Indicate, "grab" or "composite" sample with an "X."
8. Record matrix (e.g., aqueous, soil).
9. List the analyses/container volume across top.
10. Enter the total number of containers per Field Sample No. in the "Subtotal" column.
11. Enter total number of containers submitted per analysis requested.
12. State the carrier service and airbill number, analytical laboratory, and custody seal numbers.
13. List any comments or special requests in the "Remarks" section.
14. Sign, date, and time the "Relinquished By" section when the cooler is relinquished to the next party.
15. Upon completion of the form, retain the shipper copy and place the forms and the other copies in a zip seal bag to protect from moisture. Affix the zip seal bag to the inside lid of the sample cooler to be sent to the designated laboratory.

4.0 MAINTENANCE

Not applicable.

5.0 PRECAUTIONS

None.

STANDARD OPERATING PROCEDURE 30.1
SOIL SAMPLING

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for sampling surface and subsurface soils.

2.0 MATERIALS

- Stainless steel scoop, spoon, trowel, knife, spatula, (as needed);
- Split-spoon, Shelby tube, or core barrel sampler;
- Hand auger or push tube sampler;
- Drill rig and associated equipment (subsurface soil);
- Stainless steel bowls;
- Photoionization detector or other appropriate instrument as specified in site-specific health and safety plan;
- Sampling equipment for collection of volatile organic samples;
- Appropriate sample containers;
- Appropriate sample labels and packaging material.;
- Personal protective equipment and clothing (PPE) per site-specific health and safety plan; and
- Decontamination equipment and supplies (SOP 80.1).

3.0 PROCEDURE

3.1 DOCUMENTATION

Soil sampling information should be recorded in the field logbooks as described in SOPs 10.1 and 10.2.

3.2 SURFICIAL SOIL SAMPLES

The targeted depths for surficial soil samples (surface and near surface) will be specified in the work plan addenda developed for site-specific investigations.

1. All monitoring equipment should be appropriately calibrated before beginning sampling according to the requirements of the work plan addenda and SOP 90.1 or 90.2.
2. All sampling equipment should be appropriately decontaminated before and after use according to the requirements of the work plan addendum and SOP 80.1.
3. Use a spade, shovel, or trowel or other equipment (manufactured from material, which is compatible with the soil to be sampled) to remove any overburden material present (including vegetative mat) to the level specified for sampling.
4. Measure and record the depth at which the sample will be collected with an engineers scale or tape.

5. Remove the thin layer that was in contact with the overburden removal equipment using a clean stainless steel scoop or equivalent and discard it.
6. Begin sampling with the acquisition of any discrete sample(s) for analysis of volatile organic compounds (VOCs), with as little disturbance as possible. VOC samples will not be composited or homogenized.
7. When a sample will not be collected with a core type of sampler (push tube, split spoon, etc.), the sample for VOC analysis will be collected from freshly exposed soil. The method of collection will follow the procedures specified in SOP 30.8 (Methanol Preservation Method) or 30.9 (En Core® Method) based on the requirements of the work plan addenda.
8. Field screen the sample with properly calibrated photoionization detector (PID) or other appropriate instrument. Cut a cross-sectional slice from the core or center of the sample and insert the monitoring instrument(s). Based on the screening results, collect the VOC fraction, as applicable.
9. Collect a suitable volume of sample from the targeted depth with a clean stainless steel scoop (or similar equipment), push tube sampler, or bucket auger
10. For core type of samplers, rough trimming of the sampling location surface should be considered if the sampling surface is not fresh or other waste, different soil strata, or vegetation may contaminate it. Surface layers can be removed using a clean stainless steel, spatula, scoop, or knife. Samples collected with a bucket auger or core type of sampler should be logged per the requirements of SOP 10.3.
11. If homogenization or compositing of the sampling location is not appropriate for the remaining parameters, the sample should be directly placed into appropriate sample containers with a stainless steel spoon or equivalent.
12. If homogenization of the sample location is appropriate or compositing of different locations is desired, transfer the sample to a stainless steel bowl for mixing. The sample should be thoroughly mixed with a clean stainless steel spoon, scoop, trowel, or spatula and then placed in appropriate sample containers per the requirements for containers and preservation specified in work plan addenda. Secure the cap of each container tightly.
13. Appropriately, label the samples (SOP 50.1), complete the chain-of-custody (SOP 10.4), and package the samples for shipping (SOP 50.2).
14. Return any remaining unused soil to the original sample location. If necessary, add clean sand to bring the subsampling areas back to original grade. Replace the vegetative mat over the disturbed areas.

3.3 SUBSURFACE SAMPLES

All sampling equipment should be appropriately decontaminated before and after use according to the requirements of the work plan addendum and SOP 80.1.

1. All monitoring equipment should be appropriately calibrated before sampling according to the requirement of the work plan addendum and SOP 90.1 or SOP 90.2.
2. All sampling equipment should be appropriately decontaminated before and after use according to the requirements of the work plan addendum and SOP 80.1.
3. Collect split-spoon; core barrel, Shelby tube, sonic core or other similar samples during drilling.
4. Upon opening sampler or extruding sample, immediately screen soil for VOCs using a PID or appropriate instrument. If sampling for VOCs, determine the area of highest concentration; use a

stainless steel knife, trowel, or lab spatula to cut the sample; and screen for VOCs with monitoring instrument(s).

5. Log the sample on the boring log before extracting from the sampler per the requirements of SOP 10.3.
6. Any required VOC samples will be collected first followed by the other parameters. VOC samples will not be composited or homogenized and will be collected from the area exhibiting the highest screening level. The method of VOC sample collection will follow the procedures specified in SOP 30.8 (Methanol Preservation Method) or 30.9 (En Core® Method) based on the requirements of the work plan addenda.
7. Field screen the sample with properly calibrated photoionization detector (PID) or other appropriate instrument. Cut a cross-sectional slice from the core or center of the sample and insert the monitoring instrument(s). Based on the screening results, collect the VOC fraction, as applicable.
8. Rough trimming of the sampling location surface should be considered if the sampling surface is not fresh or other waste, different soil strata, or vegetation may contaminate it. Surface layers can be removed using a clean stainless steel, spatula, scoop, or knife.
9. If homogenization or compositing of the sampling location is not appropriate for other parameters, the sample should be directly placed into appropriate sample containers with a stainless steel spoon or equivalent.
10. If homogenization of the sample location is appropriate or compositing of different locations is desired, transfer the sample to a stainless steel bowl for mixing. The sample should be thoroughly mixed with a clean stainless steel spoon, scoop, trowel, or spatula and placed in appropriate sample containers per the requirements for containers and preservation specified in work plan addenda. Secure the cap of each container tightly.
15. Appropriately, label the samples (SOP 50.1), complete the chain-of-custody (SOP 10.4), and package the samples for shipping (SOP 50.2).
16. Discard any remaining sample into the drums used for collection of cuttings.
17. Abandon borings according to procedures outlined in SOP 20.2.

3.4 INVESTIGATION-DERIVED MATERIAL

Investigation-derived material will be managed in accordance with procedures defined in the work plan addenda for the site being investigated and SOP 70.1.

NOTES: If sample recoveries are poor, it may be necessary to composite samples before placing them in jars. In this case, the procedure will be the same except that two split-spoon samples (or other types of samples) will be mixed together. The boring log should clearly state that the samples have been composited, which samples were composited, and why the compositing was done. In addition, VOC fraction should be collected from the first sampling device.

When specified, samples taken for geotechnical analysis (e.g., percent moisture, density, porosity, and grain size) will be undisturbed samples, such as those collected using a thin-walled (Shelby tube) sampler, sonic core sampler, etc.

4.0 MAINTENANCE

Not applicable.

5.0 PRECAUTIONS

Refer to the site-specific health and safety plan.

Soil samples will not include vegetative matter, rocks, or pebbles unless the latter are part of the overall soil matrix.

STANDARD OPERATING PROCEDURE 30.7
SAMPLING STRATEGIES

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate sampling strategies for sampling various media.

2.0 MATERIALS

- Historical site data;
- Site topography;
- Soil types; and
- Sampled media.

3.0 PROCEDURE

The primary goal of any investigation is to collect samples representative of existing site conditions. Statistics are generally used to ensure samples are as representative as possible. Sampling plans may employ more than one approach to ensure project data quality objectives are adequately addressed. A comparison of sampling strategies is presented in Table 1.

3.1 CLASSICAL STATISTICAL SAMPLING

Classical statistical sampling strategies are appropriately applied to either sites where the source of contamination is known or small sites where the entire area is remediated as one unit. Primary limitations of this sampling approach include (1) inability to address media variability; (2) inadequate characterization of heterogenous sites; and (3) inadequate characterization of sites with unknown contamination characteristics.

3.1.1 Simple Random Sampling

Simple random sampling is generally more costly than other approaches because of the number of samples required for site characterization. This approach is generally used when minimal site information is available and visible signs of contamination are not evident and includes the following features:

- Sampling locations are chosen using random chance probabilities.
- This strategy is most effective when the number of sampling points is large.

3.1.2 Stratified Random Sampling

This sampling approach is a modification to simple random sampling. This approach is suited for large site investigations that encompass a variety of soil types, topographic features, and/or land uses. By dividing the site into homogenous sampling strata based on background and historical data, individual random sampling techniques are applied across the site. Data acquired from each stratum can be used to determine the mean or total contaminant levels and provide these advantages:

- Increased sampling precision results due to sample point grouping and application of random sampling approach.
- Control of variances associated with contamination, location, and topography.

3.1.3 Systematic Grid

The most common statistical sampling strategy is termed either systematic grid or systematic random sampling. This approach is used when a large site must be sampled to characterize the nature and extent of contamination.

Samples are collected at predetermined intervals within a grid pattern according to the following approach:

- Select the first sampling point randomly; remaining sampling points are positioned systematically from the first point.
- Determine the grid design: one or two-dimensional. One-dimensional sample grids may be used for sampling along simple man-made features. Two-dimensional grid systems are ideal for most soil applications.
- Determine the grid type: square or triangular. Sampling is usually performed at each grid-line intersection. Other strategies include sampling within a grid center or obtaining composite samples within a grid.
- Each stratum is sampled based on using the simple random sampling approach but determined using a systematic approach.

3.1.4 Hot-Spot Sampling

Hot spots are small, localized areas of media characterized by high contaminant concentrations. Hot-spot detection is generally performed using a statistical sampling grid. The following factors should be addressed:

- Grid spacing and geometry. The efficiency of hot-spot searches is improved by using a triangular grid. An inverse relationship exists between detection and grid point spacing, e.g., the probability of hot-spot detection is increased as the spacing between grid points is decreased.
- Hot-spot shape/size. The larger the hot spot, the higher the probability of detection. Narrow or semi-circular patterns located between grid sampling locations may not be detected.
- False-negative probability. Estimate the false negative (β-error) associated with hot-spot analysis.

3.1.5 Geostatistical Approach

Geostatistics describe regional variability in sampling and analysis by identifying ranges of correlation or zones of influence. The general two-stage approach includes the following:

- Conducting a sampling survey to collect data defining representative sampling areas.
- Defining the shape, size, and orientation of the systematic grid used in the final sampling event.

3.2 NON-STATISTICAL SAMPLING

3.2.1 Biased Sampling

Specific, known sources of site contamination may be evaluated using biased sampling. Locations are chosen based on existing information.

3.2.2 Judgmental Sampling

This sampling approach entails the subjective selection of sampling locations that appear to be representative of average conditions. Because this method is highly biased, it is suggested that a measure of precision be included through the collection of multiple samples.

4.0 MAINTENANCE

Not applicable.

TABLE 1
SAMPLING STRATEGIES

SAMPLING STRATEGY	DESCRIPTION	APPLICATION	LIMITATIONS
Classical Statistical Sampling Strategies			
Simple Random Sampling	Representative sampling locations are chosen using the theory of random chance probabilities.	Sites where background information is not available and no visible signs of contamination are present.	May not be cost-effective because samples may be located too close together. Does not take into account spatial variability of media.
Stratified Random Sampling	Site is divided into several sampling areas (strata) based on background or site survey information.	Large sites characterized by a number of soil types, topographic features, past/present uses, or manufacturing storage areas.	Often more cost-effective than random sampling. More difficult to implement in the field and analyze results. Does not take into account spatial variability of media.
Systematic Grid Sampling	Most common statistical strategy; involves collecting samples at predetermined, regular intervals within a grid pattern.	Best strategy for minimizing bias and providing complete site coverage. Can be used effectively at sites where no background information exists. Ensures that samples will not be taken too close together.	Does not take into account spatial variability of media.
Hot-Spot Sampling	Systematic grid sampling strategy tailored to search for hot spots.	Sites where background information or site survey data indicate that hot spots may exist.	Does not take into account spatial variability of media. Tradeoffs between number of samples, chance of missing a hot spot, and hot spot size/shape must be weighed carefully.
Geostatistical Approach	Representative sampling locations are chosen based on spatial variability of media. Resulting data are analyzed using kriging, which creates contour maps of the contaminant concentrations and the precision of concentration estimates.	More appropriate than other statistical sampling strategies because it takes into account spatial variability of media. Especially applicable to sites where presence of contamination is unknown.	Previous investigation data must be available and such data must be shown to have a spatial relationship.
Non-Statistical Sampling Strategies			
Biased Sampling	Sampling locations are chosen based on available information.	Sites with known contamination sources.	Contaminated areas can be overlooked if background information or visual signs of contamination do not indicate them. Best used if combined with a statistical approach, depending on the project objectives.
Judgmental Sampling	An individual subjectively selects sampling locations that appear to be representative of average conditions.	Homogenous, well-defined sites.	Not usually recommended due to bias imposed by individual, especially for final investigations.

STANDARD OPERATING PROCEDURE 50.1
SAMPLE LABELS

1.0 SCOPE AND APPLICATION

Every sample will have a sample label uniquely identifying the sampling point and analysis parameters. The purpose of this standard operating procedure (SOP) is to delineate protocols for the use of sample labels. An example label is included as Figure 50.1-A. Other formats with similar levels of detail are acceptable.

2.0 MATERIALS

- Sample label; and
- Indelible marker.

3.0 PROCEDURE

The use of preprinted sample labels is encouraged and should be requested from the analytical support laboratory during planning activities.
As each sample is collected, fill out a sample label ensuring the following information has been collected:

- Project name;
- Sample ID: enter the SWMU number and other pertinent information concerning where the sample was taken. This information should be included in site-specific work plan addenda;
- Date of sample collection;
- Time of sample collection;
- Initials of sampler(s);
- Analyses to be performed (NOTE: Due to number of analytes, details of analysis should be arranged with lab *a priori*); and
- Preservatives (water samples only).

Double-check the label information to make sure it is correct. Detach the label, remove the backing and apply the label to the sample container. Cover the label with clear tape, ensuring that the tape completely encircles the container.

4.0 MAINTENANCE

Not applicable.

5.0 PRECAUTIONS

None.

STANDARD OPERATING PROCEDURE 50.2
SAMPLE PACKAGING

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for the packing and shipping of samples to the laboratory for analysis.

2.0 MATERIALS

- Waterproof coolers (hard plastic or metal);
- Metal cans with friction-seal lids (e.g., paint cans);
- Chain-of-custody forms;
- Chain-of-custody seals (optional);
- Packing material;
- Sample documentation;
- Ice;
- Plastic garbage bags;
- Clear Tape;
- Zip-top plastic bags; and
- Temperature blanks provided by laboratory for each shipment.

3.0 PROCEDURE

1. Check cap tightness and verify that clear tape covers label and encircles container.
2. Wrap sample container in bubble wrap or closed cell foam sheets. Samples may be enclosed in a secondary container consisting of a clear zip-top plastic bag. Sample containers must be positioned upright and in such a manner that they will not touch during shipment.
3. Place several layers of bubble wrap, or at least 1 in. of vermiculite on the bottom of the cooler. Line cooler with open garbage bag, place all the samples upright inside the garbage bag and tie.
4. Double bag and seal loose ice to prevent melting ice from soaking the packing material. Place the ice outside the garbage bags containing the samples.
5. Pack shipping containers with packing material (closed-cell foam, vermiculite, or bubble wrap). Place this packing material around the sample bottles or metal cans to avoid breakage during shipment.
6. A temperature blank (provided by laboratory) will be included in each shipping container to monitor the internal temperature. Samples should be cooled to 4 degrees C on ice immediately after sampling.
7. Enclose all sample documentation (i.e., Field Parameter Forms, Chain-of-Custody forms) in a waterproof plastic bag and tape the bag to the underside of the cooler lid. If more than one cooler is being used, each cooler will have its own documentation. Add the total number of shipping containers included in each shipment on the chain-of-custody form.

8. Seal the coolers with signed and dated custody seals so that if the cooler were opened, the custody seal would be broken. Place clear tape over the custody seal to prevent damage to the seal.
9. Tape the cooler shut with packing tape over the hinges and place tape over the cooler drain.
10. Ship all samples via overnight delivery on the same day they are collected if possible.

4.0 MAINTENANCE

Not applicable.

5.0 PRECAUTIONS

5.1 PERMISSIBLE PACKAGING MATERIALS

- Non-absorbent
  - — Bubble wrap; and
  - — Closed cell foam packing sheets.
- Absorbent
  - — Vermiculite.

5.2 NON-PERMISSIBLE PACKAGING MATERIALS

- Paper;
- Wood shavings (excelsior); and
- Cornstarch “peanuts”.

STANDARD OPERATING PROCEDURE 70.1
INVESTIGATION-DERIVED MATERIAL

1.0 SCOPE AND APPLICATION

Management of investigation-derived material (IDM) minimizes the potential for the spread of waste material onsite or offsite through investigation activities. The purpose of this standard operating procedure (SOP) is to provide general guidelines for appropriate management of potentially contaminated materials derived from the field investigations. Specific procedures related to the transportation and disposal of hazardous waste are beyond the scope of this SOP.

2.0 INTRODUCTION

Investigation derived material (IDM) consists of waste materials that are known or suspected to be contaminated with waste substances through the actions of sample collection or personnel and equipment decontamination. These materials include decontamination solutions, disposable equipment, drill cuttings and fluids, and water from groundwater monitoring well development and purging. To the extent possible, the site manager will attempt to minimize the generation of these materials through careful design of decontamination schemes and groundwater sampling programs. Testing conducted on soil and water investigation-derived material will show if they are also hazardous wastes as defined by RCRA. This will determine the proper handling and ultimate disposal requirements.

The criteria for designating a substance as hazardous waste according to RCRA is provided in 40 CFR 261.3. If IDM meet these criteria, RCRA requirements will be followed for packaging, labeling, transporting, storing, and record keeping as described in 40 CFR 262.34. Those materials that are judged potentially to meet the criteria for a regulated solid or hazardous waste will be placed in DOT-approved 55-gallon steel drums or another type of DOT approved container; based on waste characteristics and volume.

Investigation-derived material will be appropriately placed in containers, labeled, and tested to determine disposal options in accordance with RCRA regulations and Virginia Hazardous Waste Management Regulations.

3.0 INVESTIGATION-DERIVED MATERIAL MANAGEMENT

Procedures that minimize potential for the spread of waste material include minimizing the volume of material generated, material segregation, appropriate storage, and disposal according to RCRA requirements.

3.1 WASTE MINIMIZATION

In the development of work plan addenda, each aspect of the investigation will be reviewed to identify areas where excess waste generation can be eliminated. General procedures that will eliminate waste include avoidance of unnecessary exposure of materials to hazardous material and coordination of sampling schedules to avoid repetitious purging of wells and use of sampling equipment.

3.2 WASTE SEGREGATION

Waste accumulation and management procedures to be used depend upon the type of material generated. For this reason, IDM described below are segregated into separate 55-gallon storage drums or other appropriate DOT containers. Waste materials that are known to be free of potential hazardous waste contamination (such as broken sample bottles or equipment containers and wrappings) must be collected separately for disposal to municipal systems. Large plastic garbage or "lawn and leaf" bags are useful for collecting this trash. Even "clean" sample bottles or Tyvek should be disposed of with care. Although they are not legally a problem, if

they are discovered by the public they may cause concern. Therefore, items that are known to be free from contamination but are also known to represent "hazardous or toxic waste" to the public must not be disposed of in any public trash receptacle, such as found at your hotel or park.

3.2.1 Decontamination Solutions

Solutions considered investigation-derived materials range from detergents, organic solvents, and acids used to decontaminate small hand samplers to steam-cleaning rinsate used to wash drill rigs and other large equipment. These solutions are to be placed in 55-gallon drums with bolt-sealed lids or other appropriate DOT approved containers. Residual liquid IDM from decontamination pads will be removed and appropriately placed in container(s) at the end of each field day.

3.2.2 Soil Cuttings and Drilling Muds

Soil cuttings are solid to semi-solid soils generated during trenching activities or drilling for the collection of subsurface soil samples or the installation of monitoring wells. Depending on the type of drilling, drilling fluids known as "muds" may be used to remove soil cuttings. Drilling fluids flushed from the borehole must be directed into a settling section of a mud pit. This allows reuse of the decanted fluids after removal of the settled sediments. Drill cuttings, whether generated with or without drilling fluids, are to be removed with a flat-bottomed shovel and placed in 55-gallon drums with bolt-sealed lids or other appropriate DOT containers, as conditions or volume of IDM dictate.

3.2.3 Well Development and Purge Water

Well development and purge water is removed from monitoring wells to repair damage to the aquifer following well installation, obtain characteristic aquifer groundwater samples, or measure aquifer hydraulic properties. The volume of groundwater to be generated will determine the appropriate container to be used for accumulation of IDM.

For well development and purging, 55-gallon drums are typically an efficient container for accumulation. When larger volumes of water are removed from wells, such as when pumping tests are conducted, the use of large-volume portable tanks such as "Baker Tanks" should be considered for IDM accumulation.

Analytical data for groundwater samples associated with the well development and purge water will be used to assist in characterizing IDM and evaluating disposal options.

3.2.4 Personal Protective Equipment and Disposable Sampling Equipment

Personal protective equipment and clothing (PPE) may include such items as Tyvek coveralls, gloves, booties, and APR cartridges. Disposable sampling equipment may include such items as plastic sheeting, bailers, disposable filters, disposable tubing and paper towels. PPE and disposable sampling equipment that have or may have contacted contaminated media (soil, water, etc.) will be segregated and placed in 55-gallon drums separate from soil and water IDM. Disposition of this type of IDM will be determined by the results of IDM testing of the media in which the PPE and sampling equipment contacted.

3.3 MATERIAL ACCUMULATION

The IDM in containers must be placed in an appropriate designated RCRA container accumulation area at RFAAP, where it is permissible to accumulate such waste. IDM placed into a designated 90-day accumulation area will be properly sealed, labeled and covered. All drums will be placed on pallets.

A secure and controlled waste staging area will be designated by the installation prior the commencement of field sampling activities. Per the facility's requirements as a RCRA large quantity generator, waste accumulation cannot exceed 90 days for materials presumed or shown to be RCRA-designated hazardous wastes; waste which is known not to be RCRA-designated waste should be promptly disposed to municipal waste systems or appropriate facility.

3.3.1 IDM Accumulation Containers

Containers will be DOT-approved (DOT 17H 18/16GA OH unlined) open-head steel drums or other DOT approved container, as appropriate.

Container lids should lift completely off and be secured by a bolt ring (for drum). Order enough containers to accumulate all streams of expected IDM including soil, PPE and disposable sampling equipment, decontamination water, purge water, etc.

Solid and liquid waste streams will not be mixed in a container. PPE and expendable sampling equipment will be segregated from other IDM and placed in different containers than soil. Containers inside containers are not permitted. PPE must be placed directly in a drum not in a plastic bag.

Pallets are often required to allow transport of filled drums to the staging area with a forklift. Normal pallets are 3×4 ft and will hold two to three 55-gallon drums depending on the filled weight. If pallets are required for drum transport or storage, field personnel are responsible for ensuring that the empty drums are placed on pallets before they are filled and that the lids are sealed on with the bolt-tighten ring after the drums are filled. Because the weight of one drum can exceed 500 lbs, under no circumstances should personnel attempt to move the drums by hand.

3.3.2 Container Labeling

Each container that is used to accumulate IDM will be appropriately labeled at the time of accumulation and assigned a unique identification number for tracking purposes. The following information will be written in permanent marker on a drum label affixed on the exterior side at a location at least two-thirds of the way up from the bottom of the drum.

- Facility name.
- Accumulation start date and completion date.
- Site identifier information (SWMU, boring, well, etc.).
- Description of IDM.
- Drum ID No.

4.0 MATERIAL CHARACTERIZATION AND DISPOSAL

IDM will be characterized and tested to determine whether it is a hazardous waste as defined by 40 CFR Part 261 and to determine what disposal options exist in accordance with RCRA regulations and the Virginia Hazardous Waste Management Regulations (VHWMR).

In general, IDM will be considered a hazardous waste if it contains a listed hazardous waste or if the IDM exhibits a characteristic of hazardous waste.

Work plan addenda will identify the appropriate characterization and testing program for IDM based on the following:

- Site-specific conditions related to chemicals of concern, etc.
- The nature and quantity of expected IDM to be generated during site-specific investigations.
- Applicable Federal, State, and local regulations, such as RCRA, VHWMR regulations and policies and procedures, and Army Regulation 200-1.
- RFAAP specific requirements and policies for IDM characterization and disposal at the time of the investigation.

In general, appropriate USEPA SW 846 Test Methods for Evaluating Solid Waste will be used for testing IDM and will be specified in work plan addenda. Other appropriate test methods may be specified by RFAAP in addition to SW 846 Methods that are specific to installation operations, the site of interest (percent explosive content, reactivity, etc.), or requirements for disposal at RFAAP water treatment facilities or publicly owned treatment works.

Responsibility for the final disposal of IDM will be determined before field activities are begun and will be described in work plan addenda. Off-site disposal of IDM will be coordinated with RFAAP (generator) to ensure appropriate disposition. The contractor will coordinate IDM transportation and disposal activities for RFAAP (generator).

At the direction of RFAAP, appropriate waste manifests will be prepared by the USACE contractor or Alliant Techsystems subcontractor for transportation and disposal. Alliant Techsystems or other appropriate RFAAP entity will be listed as the generator and an appointed representative from RFAAP will review and sign the manifest for offsite disposal.

RFAAP will make the final decision on the selection of the transporter, storage, and disposal facility (TSDFs) or recycling facility. RFAAP will provide the contractor a listing of previously used TSDFs for priority consideration. Proposed facilities that are not included on the listing are required to provide a copy of the TSDFs most recent state or federal inspection to the installation. Waste characterization and testing results will be submitted to RFAAP (generator) for review and approval before final disposition of the material.

Hazardous waste: Prior to final disposition, a hazardous waste manifest will be furnished by the TSDF to accompany transport to the disposal facility. Following final disposition, a certificate of disposal will be furnished by the disposal facility. Copies of the manifests and certificates of disposal are to be provided to RFAAP and retained on file by the contractor or subcontractor.

4.0 PRECAUTIONS

- Because the weight of one drum can exceed 500 lbs, under no circumstances should personnel attempt to move drums by hand.
- Refer to the site-specific health and safety plan when managing IDM.

5.0 REFERENCES

Safety Rules for Contractors and Subcontractors, (As Updated). Alliant Techsystems, Incorporated, Radford Army Ammunition Plant.

STANDARD OPERATING PROCEDURE 80.1
DECONTAMINATION

1.0 SCOPE AND APPLICATION

Before leaving the site, all personnel or equipment involved in intrusive sampling or having entered a hazardous waste site during intrusive sampling must be thoroughly decontaminated to prevent adverse health effects and minimize the spread of contamination. Equipment must be decontaminated between sites to preclude cross-contamination. Decontamination water will be free of contaminants as evidenced through either chemical analyses or certificates of analysis. This standard operating procedure (SOP) describes general decontamination requirements for site personnel and sampling equipment. Decontamination procedures for contaminants requiring a more stringent procedure, e.g., dioxins/furans, will be included in site-specific addenda.

2.0 MATERIALS

- Plastic sheeting, buckets or tubs, pressure sprayer, rinse bottles, and brushes;
- U.S. Army Corps of Engineers or installation approved decontamination water source;
- Deionized ultra-filtered, HPLC-grade organic free water (DIUF);
- Non-phosphate laboratory detergent;
- Nitric Acid, 0.1 Normal (N) solution;
- Pesticide-grade solvent, Methanol;
- Aluminum foil;
- Paper towels;
- Plastic garbage bags; and
- Appropriate containers for management of investigation-derived material (IDM).

3.0 PROCEDURE

3.1 SAMPLE BOTTLES

At the completion of each sampling activity the exterior surfaces of the sample bottles must be decontaminated as follows:

- Be sure that the bottle lids are on tight.
- Wipe the outside of the bottle with a paper towel to remove gross contamination.

3.2 PERSONNEL DECONTAMINATION

Review the site-specific health and safety plan for the appropriate decontamination procedures.

3.3 EQUIPMENT DECONTAMINATION

3.3.1 Drilling Rigs

Drilling rigs and associated equipment, such as augers, drill casing, rods, samplers, tools, recirculation tank, and water tank (inside and out), will be decontaminated before site entry, after over-the-road mobilization and immediately upon departure from a site after drilling a hole. Supplementary cleaning will be performed before site entry. There is a likelihood that contamination has accumulated on tires and as spatter or dust en route from one site to the next.

1. Place contaminated equipment in an enclosure designed to contain all decontamination residues (water, sludge, etc.).
2. Steam-clean equipment until all dirt, mud, grease, asphaltic, bituminous, or other encrusting coating materials (with the exception of manufacturer-applied paint) has been removed.
3. Water used will be taken from an approved source.
4. When cross-contamination from metals is a concern, rinse sampling components such as split spoons, geo-punch stems, and augers with nitric acid, 0.1N.
5. Rinse with DIUF water.
6. When semi-volatile and non-volatile organics may be present, rinse the sampling components with pesticide-grade solvent methanol.
7. Double rinse the sampling components with DIUF water.
8. Decontamination residues and fluids will be appropriately managed as IDM per work plan addenda and SOP 80.1.

3.3.2 Well Casing and Screen

Prior to use, well casing and screen materials will be decontaminated. This activity will be performed in the leak proof, decontamination pad, which will be constructed prior to commencement of the field investigation. The decontamination process will include:

- Steam cleaning with approved source water.
- Rinse with DUIF water.
- Air-dry on plastic sheeting.
- Wrap in plastic sheeting to prevent contamination during storage/transit.

3.3.3 Non Dedicated Submersible Pumps Used for Purging and Sampling

1. Scrub the exterior of the pump to remove gross (visible) contamination using appropriate brushes, approved water, and non-phosphate detergent (steam cleaning may be substituted for detergent scrub).
2. Pump an appropriate amount of laboratory detergent solution (minimum 10 gallons) to purge and clean the interior of the pump.
3. Rinse by pumping no less than 10 gallons of approved water to rinse.
4. Rinse the pump exterior with approved decontamination water.
5. When cross-contamination from metals is a concern, rinse the pump exterior with approved nitric acid 0.1N solution.

6. Rinse the pump exterior with DIUF water.
7. When semi-volatile and non-volatile organics may be present, rinse the pump exterior with pesticide-grade solvent methanol.
8. Double rinse the pump exterior with DIUF water.
9. Air-dry on aluminum foil or clean plastic sheeting.
10. Wrap pump in aluminum foil or clean plastic sheeting, or store in a clean, dedicated PVC or PTFE storage container.
11. Solutions and residuals generated from decontamination activities will be managed appropriately as IDM per work plan addenda and SOP 80.1.

3.3.4 Sample Equipment and Measuring Water Level Devices

1. Scrub the equipment to remove gross (visible) contamination using appropriate brush (es), approved water, and non-phosphate detergent.
2. Rinse with approved source water.
3. When cross-contamination from metals is a concern, rinse the sampling equipment with approved nitric acid 0.1N solution.
4. Rinse equipment with DIUF water.
5. When semi-volatile and non-volatile organics may be present, rinse the sampling equipment with pesticide-grade solvent methanol.
6. Double rinse the sampling equipment with DIUF water.
7. Air-dry on aluminum foil or clean plastic sheeting.
8. Wrap in aluminum foil, clean plastic sheeting, or zip top bag or store in a clean, dedicated PVC or PTFE storage container.
9. Solutions and residuals generated from decontamination activities will be managed appropriately as IDM per work plan addenda and SOP 80.1.

3.3.5 Other Sampling and Measurement Probes

Temperature, pH, conductivity, Redox, and dissolved oxygen probes will be decontaminated according to manufacturer's specifications. If no such specifications exist, remove gross contamination and triple-rinse probe with DIUF water.

4.0 PRECAUTIONS

- Manage IDM appropriately according to the requirements specified in work plan addenda.
- Follow appropriate procedures as specified in the site-specific health and safety plan.

USACE. 2001. Requirements for the Preparation of Sampling and Analysis Plans. EM 200-1-3. 1 February.

STANDARD OPERATING PROCEDURE 90.1
PHOTOIONIZATION DETECTOR (HNu Model PI–101 and HW–101)

1.0 SCOPE AND APPLICATION

The purpose of this standard operating procedure (SOP) is to delineate protocols for field operations with a photoionization detector (HNu Systems Model PI–101 or HW–101). The photoionization detector (PID) detects total ionizables; hence it is used to monitor both organic and inorganic vapors and gases to determine relative concentrations of air contaminants. This information is used to establish level of protection and other control measures such as action levels. The PID cannot effectively detect compounds having ionization potentials above the photon energy level of the lamp used; therefore, methane, which has an ionization potential of 12.98 eV, is undetectable by PIDs because the lamps produce 9.5, 10.2, or 11.7 eV.

Use of brand names in this SOP is in not intended as an endorsement or mandate that a given brand be used. Alternate equivalent brands of detectors, sensors, meters, etc., are acceptable. If alternate equipment is to be used, the contractor shall provide applicable and comparable SOPs for its maintenance and calibration.

2.0 MATERIALS

- HNu Systems Model PI–101 or HW–101 survey probe with 9.5, 10.2, or 11.7 eV lamp;
- Lead-acid gel-cell battery;
- Calibration gas (e.g., isobutylene, 101 ppm) with regulator;
- Tygon tubing;
- Tedlar bag (optional);
- Instrument logbook; and
- Field logbook.

3.0 PROCEDURE

These procedures are to be followed when using the HNu in the field.

3.1 STARTUP

1. Before attaching the probe, check the function switch on the control panel to ensure that it is in the off position. Attach the probe by plugging it into the interface on the top of the readout module.
2. Turn the function switch to the battery check position. The needle on the meter should read within or above the green battery arc on the scale; if not, recharge the battery. If the red indicator light comes on, the battery needs recharging or service may be indicated.
3. Turn the function switch to any range setting. Listen for the hum of the fan motor. Check meter function by holding a solvent-based marker pen near the sample intake. If there is no needle deflection, look briefly into the end of the probe (no more than 1 or 2 sec) to see if the lamp is on; if it is on, it will give a purple glow. Do not stare into the probe any longer than 2 sec. Long-term exposure to UV light can damage the eyes. (See further information in Section 5.)
4. To zero the instrument, turn the function switch to the standby position and rotate the zero adjustment until the meter reads zero. A calibration gas is not needed since this is an electronic zero adjustment. If the span adjustment setting is changed after the zero is set, the zero should be rechecked and adjusted if

necessary. Allow the instrument to warm up for 3–5 min to ensure that the zero reading is stable. If necessary, readjust the zero.

3.2 OPERATIONAL CHECK

Follow the startup procedure in Section 3.1.

With the instrument set on the 0–20 range, hold a solvent-based marker near the probe tip. If the meter deflects upscale, the instrument is working.

3.3 FIELD CALIBRATION PROCEDURE

1. Follow the startup procedures in Section 3.1 and the operational check in Section 3.2.
2. Set the function switch to the range setting for the concentration of the calibration gas.
3. Attach a regulator HNu P/N 101-351 or equivalent (flow = 200 to 300 ml/min) to a disposable cylinder of isobutylene (HNu 101-351 or equivalent). Connect the regulator to the probe of the HNu with a piece of clean Tygon tubing. Turn on the valve of the regulator.
4. After 5 sec, adjust the span dial until the meter reading equals the benzene concentration of the calibration gas used, corrected to its equivalence, which should be marked on the canister (Isobutylene ~0.7X benzene).
5. Record in the field log the instrument ID No., serial No., initial and final span settings, date, time, location, concentration and type of calibration gas used, and the signature of the person who calibrated the instrument.
6. If the HNu does not function or calibrate properly, the project equipment manager is to be notified as soon as possible. Under no circumstances is work requiring monitoring with a PI–101 or HW–101 to be done with a malfunctioning instrument.

3.4 CALIBRATION TO A GAS OTHER THAN ISOBUTYLENE

The HNu may be calibrated to any certified calibration gas. However, after calibration, all subsequent instrument readings will be relative to the calibration gas used. General procedures include the following:

1. Calibrate according to procedure 3.3.
2. Partially fill and flush one-to-two times a gas bag (Tedlar recommended) with the certified National Institute of Standards and Technology (NIST) (formerly NBS) traceable calibration gas. Then fill the bag with 1–3L of the calibration gas. If the gas is toxic, this must be done in a fume hood.
3. Feed the calibration gas into the probe with the range set for the value of the gas. After 5 sec, adjust the span control until the meter reads the value of the calibration gas.
4. Record the results of the calibration on the calibration/maintenance log and attach a new calibration sticker (if available) or correct the existing sticker to reflect the new calibration data. All subsequent readings will be relative to the new calibration gas.

3.5 OPERATION

1. Follow the startup procedure, operational check, and calibration check (refer to Section 3.1).
2. Set the function switch to the appropriate range. If the concentration of gas vapors is unknown, set the function switch to 0-20 ppm range. Adjust if necessary.
3. Prevent exposing the HNu to excessive moisture, dirt, or contaminant while monitoring the work activity as specified in the Site Health and Safety Plan.

4. When the activity is completed, or at the end of the day, carefully clean the outside of the HNu with a damp disposable towel to remove all visible dirt. Return the HNu to a secure area and place on charge. Charge after each use; the lead acid batteries cannot be ruined by over charging.
5. With the exception of the probe's inlet and exhaust, the HNu can be wrapped in clear plastic to prevent it from becoming contaminated and to prevent water from getting inside in the event of precipitation. If the instrument becomes contaminated, make sure to take necessary steps to decontaminate it. Call the Equipment Administrator if necessary; under no circumstances should an instrument be returned from the field in a contaminated condition.

4.0 MAINTENANCE

Calibration/maintenance logs are to be filled in completely whenever a PI-101 or HW-101 receives servicing. This is true of both contractor-owned and rental instruments.

The equipment manager should be called to arrange for a fresh instrument when necessary. The contractor's equipment facility is responsible for arranging all repairs that cannot be performed by the project equipment manager.

4.1 ROUTINE SERVICE

The PID's performance is affected by a number of factors. These include but are not limited to the decay of the UV lamp output over time and the accumulation of dust and other particulate material and contaminates on the lamp and in the ion chamber. Because of these factors, the PID should not be left in the field for a period of more than 2 weeks before being replaced with a fresh instrument. If a site is going to be inactive for a period of more than a week, all monitoring instruments are to be returned to the project equipment manager or his trained designee for servicing and/or reassignment. The following procedures are to be performed at the designated intervals for routine service.

Procedure	Frequency
Operational check	Before use and at instrument return
Field calibration	Before use and at instrument return
Full calibration	Bi-weekly (return instrument to equipment manager for replacement with a fresh unit)
Clean UV lamp and	Bi-weekly or as needed ion chamber
Replace UV Lamp	As needed

4.1.1 UV Lamp and Ion Chamber Cleaning

During periods of analyzer operation, dust and other foreign materials are drawn into the probe forming deposits on the surface of the UV lamp and in the ion chamber. This condition is indicated by meter readings that are low, erratic, unstable, non-repeatable, or drifting and show apparent moisture sensitivity. These deposits interfere with the ionization process and cause erroneous readings. Check for this condition regularly to ensure that the HNu is functioning properly. If the instrument is malfunctioning, call your equipment manager to arrange to have a fresh replacement.

4.1.2 Lamp eV Change

If different applications for the analyzer would require different eV lamps, separate probes, each with its own eV lamp, must be used. A single readout assembly will serve for any of the probes (9.5, 10.2, and 11.7 eV). A change in probe will require resetting of the zero control and recalibrating the instrument. The 11.7 eV

lamp will detect more compounds than either of the two lower eV lamps. However, the 11.7 eV probe needs more frequent calibration; it burns out much faster than the lower eV lamps.

5.0 PRECAUTIONS

- The HNu PI–101 and HW–101 are designed to sample air or vapors only. *Do not allow any liquids or low boiling vapors to get into the probe or meter assembly.*
- High concentrations of any gas can cause erroneous readings. High humidity can also cause the instrument readings to vary significantly from the actual concentration of gases or vapors present. This is true even through the HNu cannot react to water vapor.
- High humidity, dust, and exposure to concentrations of low boiling vapors will contaminate the ion chamber, causing a steady decrease in sensitivity.
- Continued exposure to ultraviolet light generated by the light source can be harmful to eyesight. If a visual check of the UV lamp is performed *do not look at the light source from a distance closer than 6 inches with unprotected eyes.* Use eye protection (UV-blocking sunglasses or safety glasses). Only look briefly—never more than about 2 sec.
- Place the instrument on charge after each use; the lead batteries cannot be ruined by over charging.
- If at any time the instrument does not check out or calibrate properly in the field, the equipment manager is to be notified immediately and a replacement obtained for the malfunctioning instrument. Under no circumstances should fieldwork requiring continuous air monitoring for organic vapors and/or gases be done with a malfunctioning Hnu or without a HNu or an approved comparable instrument.

PERMEABILITY TEST: FALLING HEAD - CONSTANT VOLUME U-TUBE

ASTM D 5084 - 90

Project No.: 31737767 BORING: 13SB10 Test No.: P6775

Project Name: Radford Army Ammunition Plant SAMPLE: DEPTH (ft): 2-3

Specimen - Apparatus set-up - Test Information Cell No. 5 Apparatus No. 4 Stage No.: 2

Preliminary Length/Area Calculations

Lo = 3.035 in Lo= 7.709 cm

dLc= 0.032 in Ao = 19.83 cm^2

Lc= 3.003 in Vo = 152.91 cm^3

Lc= 7.628 cm

dVc = 3 Vo * (dLc/Lo) dVc= 4.84 cm^3

Vc = 148.07 cm^3

Sc = 0.393 cm^{-1} Ac= 19.412 cm^2

1) Specimen Tested in :	x	Triaxial Cell or		Compaction Mold or		
	x	with stones or		Stones with filter paper or		top + bottom
2) Specimen orientation for:	x	Vertical or		Horizontal permeability determination		
3) During saturation: Water flushed up sides of specimen to remove ai	x	No		Yes		
4) During consolidation:	x	Top and bottom drainage or		Top		Bottom only
5) Direction of permeant :	x	Up during or		Down during permeation		
6) Permeant: water used	x	Tap		Distilled		
or		Demineralized		0.005 N calcium sulfate (CaSO4)		

Equations Used

Kt = - 0.0000750 * Sc/dT(min) * ln (ho/hf)

RT = (-0.02452*(ave. temp in C) + 1.495)

K @ 20 ºC = RT * Kt TubeC= 1.3181

TEST SUMMARY

Final Specimen and Test Conditions

Lc = 7.628 cm ε_{axial} = 1.1%

Ac = 19.415 cm^2

Vc= 148.09 cm^3 ε_{vol} = 3.2%

Sc = 0.393 cm^{-1} Sc = Lc / Ac , final

Report: ENV_12AS_CLEVELAND+/-USCS; File: RFAAP_SSP.GPJ; 12/8/2003 13SB10

Project: Radford Army Ammunition Plant- SSP Project Location: Radford, Virginia Project Number: 09604-317	Log of Borehole 13SB11 Sheet 1 of 1

Date(s) Drilled	10-09-03 1215-1245	Logged By	J. Spangler	Reviewed By	C. Lawrence
Drilling Method	Hand Auger	Drilling Contractor	URS Group, Inc.	Total Depth of Borehole	8.6 feet
Drill Rig Type	NA	Drill Bit Size/Type	3-inch Hand Auger	Ground Surface Elevation	
Groundwater Level(s)	NA	Sampling Method	Stainless-Steel 3-inch Hand Auger	Hammer Data	NA
Borehole Backfill	Bentonite Pellets	Comments			

Elevation, feet	Downhole Depth, feet	SAMPLES Type	SAMPLES Number	Recovery (feet)	PID (ppm)	Graphic Log	Lithologic Log (USCS Code)	MATERIAL DESCRIPTION	FIELD NOTES
	0			1.0	ND		ML	7.5YR 4/4 brown, Sandy Silt, very fine, slightly moist, loose, micaceous	Sample 13SB11A collected 0.0-1.0 ft bgs
	1			1.0			SM	7.5YR 4/2 brown, Silty Sand with gravel	
	2			1.0			SM	7.5YR 4/2 brown, Silty Sand Metal fragment/wire found 2.5 ft bgs	
	3			1.0	ND				
	4			1.0					Sample 13SB11B collected 4.5-5.0 ft bgs
	5			1.0	ND		SC	7.5YR 5/6 strong brown, Clay Sand, silty, very fine, slightly moist, plastic	
	6			1.0			SM	5YR 4/6 yellowish red, Silty Sand, very fine, slightly moist, micaceous, loose	
	7			1.0	ND		ML	5YR 4/6 yellowish red, Silt, trace medium sand, soft, micaceous, cohesive	
	8			0.6					Sample 13SB11C collected 8.0-8.5 ft bgs
	9							Boring Refusal 8.6 ft bgs	
	10

STATEMENT OF DATA QUALIFICATIONS

Physical/Chemical Parameters by EPA/APHA/ASTM Methods

Qualification: The referenced method requires analysis occur immediately after sample collection. Since the analysis was not performed in the field, the reported result is considered estimated. Analysis date, time and temperature were:
11-21-2008 12:30PM 23.8 C.

Analysis: USEPA-9040B

Sample/Analyte: 0811380-01 IDM-1 pH

This report shall not be reproduced except in full, without the written authorization of TriMatrix Laboratories, Inc.
Individual sample results relate only to the sample tested.
5560 Corporate Exchange Court SE • Grand Rapids, MI 49512 • (616) 975-4500 • Fax (616) 942-7463

STATEMENT OF DATA QUALIFICATIONS

TCLP Metals by EPA 1311/6000/7000 Series Methods

Qualification: The post-digestion spike recovery for this sample was outside the control limit. Sample matrix interference is suspected and the reported result must be considered as estimated.

Analysis: USEPA-6010B

Sample/Analyte: 0811380-02 IDM-1 Lead

Qualification: This analyte was not present in this sample at a concentration greater than 100 times the MDL, therefore serial dilution is not required.

Analysis: USEPA-6010B

Sample/Analyte: 0811380-02 IDM-1 Copper

Qualification: The MS and/or MSD recovery was outside the control limit. The non-spiked sample concentration for the same analyte was greater than or equal to 4 times the spiked amount; the non-spiked sample result is not qualified.

Analysis: USEPA-6010B

Sample/Analyte: 0811380-02 IDM-1 Zinc

This report shall not be reproduced except in full, without the written authorization of TriMatrix Laboratories, Inc.
Individual sample results relate only to the sample tested.
5560 Corporate Exchange Court SE • Grand Rapids, MI 49512 • (616) 975-4500 • Fax (616) 942-7463

Notes:
These data points were downloaded from a Trimble GPS
Coordinate System is Virginia State Plane South. Units are in feet.
MSL = Mean Sea Level

APPENDIX C.6

SOIL LOSS CALCULATIONS

THIS PAGE LEFT INTENTIONALLY BLANK

Calculation #1 - Annual Soil Loss

Revised Universal Soil Loss Equation (RUSLE)

$A = R \cdot K \cdot LS \cdot C \cdot P$
$= 132 \cdot 0.24 \cdot 4.4 \cdot 0.004 \cdot 1 = 0.56$ tons/acre/year

A = Loss per acre per year (tons per acre per year)

R = Rainfall value = 132 (from Figure 2-1 - USDA 1997 – Pulaski County)

K = Soil Erodibility Factor = 0.24 (Wheeling Sandy Loam)

LS = factor for horizontal length of slope and slope gradient = $0.77 \cdot 5.7 = 4.4$

$L = (l/72.6)^m = 0.77$

l=slope length= 43 feet

m= slope length factor = 0.5 (slope > 5%)

$S = (16.8 \sin(\Theta))-0.5 = 5.7$

Θ= slope angle = 21.8 degrees

C = factor for planned cover = 0.004 (from Table 11 - USDA 1978 – 70-45% cover trees and undergrowth, 85-75% duff coverage)

P = factor for management options = 1 (default)

Site Soil Loss = A·Site Area = 0.56 tons/acre/year·1.6 acres = 0.9 tons/year

Total Lead In Soil = 0.9 tons · 314 mg/kg average lead in surface soil · 2000 lbs/ton · 1kg/2.2 lbs · 1E-06 kg/mg
= 0.26 kg of lead

Calculation #2 - Single Event Soil Loss

Modified Universal Soil Loss Equation (MUSLE)

$Y = 95(Q \cdot q)^{0.56}\ K \cdot LS \cdot C \cdot P$
$= 95(0.147 \cdot 4.35)^{0.56}\ 0.24 \cdot 4.4 \cdot 0.004 \cdot 1 = 0.3$ tons of soil

Y = single storm sediment yield in tons

Q = storm runoff volume = $[(P-0.2S)^2/(P+0.8S)]$ (inches)
= 1.1 inches = 0.092 ft = 0.092 ft · 1.6 acres = 0.147 acre-ft
P = Rainfall Depth = 3.63 inches (Virginia Department on Conservation and Recreation - 10 Year Storm 24 Hour for Pulaski County)
S = 1000/CN-10 = 1000/70-10 = 4.3
CN = SCS Curve Number = 70 (Soil Group C – Forest Good Condition)

q = peak flow = $C \cdot I \cdot A$
$= 0.4 \cdot 6.8 \cdot 1.6 = 4.35\ ft^3/sec$
C = Manning's Runoff Coefficient for Sheet Flow = 0.4 (for woods – light underbrush)
I = Rainfall Intensity = 6.8 in/hour (Roanoke County IDF Curve – Duration 5 min due length of overland flow and slope)
A = Drainage Area = 1.6 acres

K = Soil Erodibility Factor = 0.24 (Wheeling Sandy Loam)

LS = factor for horizontal length of slope and slope gradient = 0.77·5.7 = 4.4
L = $(l/72.6)^m$ = 0.77
l=slope length= 43 feet
m= slope length factor = 0.5 (slope > 5%)
S = $(16.8 \sin(\Theta))-0.5$ = 5.7
Θ= slope angle = 21.8 degrees

C = factor for planned cover = 0.004 (from Table 11 - USDA 1978 – 70-45% cover trees and undergrowth, 85-75% duff coverage)

P = factor for management options = 1 (default)

Lead In Soil = 0.3 tons · 314 mg/kg average lead in surface soil · 2000 lbs/ton · 1kg/2.2 lbs · 1E-06 kg/mg
= 0.09 kg of lead

2,4-Dinitrotoluene (mg/kg)

General Statistics

Number of Valid Data	15	Number of Detected Data	1
Number of Distinct Detected Data	1	Number of Non-Detect Data	14
		Percent Non-Detects	93.33%

Warning: Only one distinct data value was detected! ProUCL (or any other software) should not be used on such a data set!

It is suggested to use alternative site specific values determined by the Project Team to estimate environmental parameters (e.g., EPC, BTV).

The data set for variable 2,4-Dinitrotoluene (mg/kg) was not processed!

Site vs Background Two-Sample t-Test

H0: Mu of Site - Mu of Background <= 0

Method	DF	t-Test Value	Critical t (0.050)	P-Value
Pooled (Equal Variance)	109	-4.994	1.659	1
Satterthwaite (Unequal Variance)	106.4	-6.595	1.659	1

Pooled SD 17.988

Conclusion with Alpha = 0.050

* Student t (Pooled) Test: Do Not Reject H0, Conclude Site <= Background
* Satterthwaite Test: Do Not Reject H0, Conclude Site <= Background

Test of Equality of Variances

Numerator DF	Denominator DF	F-Test Value	P-Value
78	31	4.496	0

Conclusion with Alpha = 0.05

* Two variances are not equal

Notes:

COPC = Chemical of Potential Concern
mg/kg = Milligram Per Kilogram
CAS = Chemical Abstracts Service
TAL = Target Analyte List
TCL = Target Compound List
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
PETN = Pentaerythritol Tetranitrate

RSL = Regional Screening Level (RSL) from October 2008 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
-- = No Value Available

Key per October 2008 Regional RSL Table:
c = cancer
n = noncancer
c* = cancer where n SL < 100X c SL
c** = cancer where n SL <10X c SL
m = concentration may exceed ceiling
s = concentration may exceed Csat

ARAR = Applicable, Relevant, and Appropriate Requirement
TBC = To-Be-Considered
IND = Adjusted Industrial RSL
RDA = Recommended Daily Allowance

[1] = Mercuric chloride soil RSL value used
[2] = 3-Methylphenol RSLs used
[3] = Pyrene RSLs used
[4] = Noncarcinogenic Residential RSL value for 2,4,6-Trinitrotoluene was used for screening
[5] = 2,3,7,8-TCDD TEQ based on relative toxicity to 2,3,7,8-TCDD (see Table E.1-2.4)

ARES = Above Residential RSL
ARES/IND = Above Residential RSL/Industrial RSL
BSL = Below Residential/Industrial RSLs
NSV = No Screening Value Available

Notes:

COPC = Chemical of Potential Concern
mg/kg = Milligram Per Kilogram
CAS = Chemical Abstracts Service
TAL = Target Analyte List
TCL = Target Compound List
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
PETN = Pentaerythritol Tetranitrate

RSL = Regional Screening Level (RSL) from October 2008 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
-- = No Value Available

Key per October 2008 Regional RSL Table:
c = cancer
n = noncancer
c* = cancer where n SL < 100X c SL
c** = cancer where n SL <10X c SL
m = concentration may exceed ceiling
s = concentration may exceed Csat

ARAR = Applicable, Relevant, and Appropriate Requirement
TBC = To-Be-Considered
IND = Adjusted Industrial RSL
RDA = Recommended Daily Allowance

[1] = Mercuric chloride soil RSL value used
[2] = 3-Methylphenol RSLs used
[3] = Pyrene RSLs used
[4] = Noncarcinogenic Residential RSL value for 2,4,6-Trinitrotoluene was used
[5] = 2,3,7,8-TCDD TEQ based on relative toxicity to 2,3,7,8-TCDD (see Table E.1-2.4)

ARES = Above Residential RSL
ARES/IND = Above Residential RSL/Industrial RSL
BSL = Below Residential/Industrial RSLs
NSV = No Screening Value Available

Notes:

CAS = Chemical Abstracts Service
MDL = Method Detection Limit
mg/kg = Milligram Per Kilogram
ug/kg = Microgram Per Kilogram
pg/g = Picogram Per Gram
TAL = Target Analyte List
TCL = Target Compound List
PCB = Polychlorinated Biphenyl
VOC = Volatile Organic Compound
SVOC = Semi-volatile Organic Compound
PAH = Polynuclear Aromatic Hydrocarbon
PETN = Pentaerythritol Tetranitrate

RSL = Regional Screening Level (RSL) from October 2008 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
-- = No Value Available

Y = MDL exceeds screening level
N = MDL does not exceed screening level
NS = No screening level available

[1] = Mercuric chloride RBC value was used
[2] = Chlordane RBC value was used
[3] = Alpha-BHC RBC value was used
[4] = Endosulfan RBC value was used
[5] = Endrin RBC value was used
[6] = Noncarcinogenic RBC value for Aroclor 1254 was used
[7] = 1,3-Dichloropropene RBC value was used
[8] = Noncarcinogenic RBC value for 2,4,6-Trichlorophenol was used
[9] = 3-Methylphenol RBC value was used
[10] = Pyrene RBC value was used
[11] = Noncarcinogenic RBC value for Hexachlorobutadiene was used
[12] = Noncarcinogenic RBC value for Hexachloroethane was used
[13] = Noncarcinogenic RBC value for 2,4,6-Trinitrotoluene was used
[14] = Noncarcinogenic RBC value for 4-Nitrotoluene was used

Notes:

CAS = Chemical Abstracts Service
pg/g = Picogram per gram
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code

Data Qualifiers:
A = Amount detected is less than the Lower Calibration Limit.
J = Analyte present. Reported value may not be accurate or precise.

RSL = Regional Screening Level (RSL) from October 2008 RSL Table
Adjusted RSLs = a Hazard Quotient (HQ) of 0.1 applied to non-carcinogens
-- = No Value Available

Key per October 2008 Regional RSL Table:
c = cancer
n = noncancer
c* = cancer where n SL < 100X c SL
c** = cancer where n SL <10X c SL
m = concentration may exceed ceiling
s = concentration may exceed Csat

Total 2,3,7,8-TCDD Equivalents are calculated by summing the detected concentration times the TEF for each chemical. Non-detects, R-flagged data, and B-flagged data are excluded from summed total.

= Concentration Exceeds Adjusted Soil Residential RSL

= Concentration Exceeds Adjusted Soil Industrial RSL

TEF = Toxicity Equivalency Factor (WHO 2005)

Table E.1-4.1a
Values used for Daily Intake Equations for Current Scenarios -Surface Soil - Exposure Medium Soil
Study Area at SWMU 13 RFI Report
Radford Army Ammunition Plant, Radford, Virginia

Notes:

(1) Best professional judgement. Based on site maintenance conducted 1 day/week with 2 weeks/year vacation. This is considered a conservative exposure frequency based on the nature of maintenance activities likely conducted at the site which would include occasional mowing along the fence line since the site not active.

(2) Fraction ingested assumed 100%.

(3) Body weight value for adolescent trespasser based on average for both gender from age 8 to 17 years from USEPA, 1997.

(4) Best Professional Judgement. Based on an exposure duration of 10 years, from age 8 to 18.

(5) Best Professional Judgement. Based on VDEQ VRP exposure frequency for a child trespasser of 6 days per month for 4 months per year.

(6) Best Professional Judgement. Based on child adherence factor.

(7) Best Professional Judgement. Based on adolescent exposure (age 8 to 18) surface area for head, forearms, hands, lower legs, and feet.

See Table E.1-4.2 for chemical specific dermal absorption fractions

Benzo(a)anthracene	56-55-3	1.30E-01
Benzo(a)pyrene	50-32-8	1.30E-01
Benzo(b)fluoranthene	205-99-2	1.30E-01
Carbazole	86-74-8	1.30E-01
Dibenz(a,h)anthracene	53-70-3	1.30E-01
Dibenzofuran	132-64-9	1.30E-01
Dimethyl Phthalate	131-11-3	1.00E-01
Nitroglycerin	55-63-0	1.00E-02

Notes:

CAS = Chemical Abstract Service

ABS_d = Dermal Absorption Fraction

*ABS_d values are taken from Exhibit 3-4, Risk Assessment Guidance for Superfund (RAGS), Volume I, Human Health Evaluation and Manual, Part E; Supplemental Guidance for Dermal Risk Assessment, July 2004, and Region III Technical Guidance, Assessing Dermal Exposure in Soil, December 1995.

Table E.1-4.3
PEF Calculations
Study Area at SWMU 13 RFI Report
Radford Army Ammunition Plant, Radford, Virginia

Commercial/Industrial Worker

Equation 4-5 from Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites. OSWER 9355.4-24. USEPA, 2002.

$$PEF = Q / C_{wind} \cdot \frac{3{,}600 s/h}{0.036 \cdot (1-V) \cdot (U_m / U_t)\text{^}3 \cdot F(x)}$$

Parameter	Value	
PEF	6.86E+08	
Q/C_{wind}	47.34	calculated below
V	0.5	default
U_m	4.69	default
U_t	11.32	default
F(x)	0.194	default

PEF = particulate emission factor (m^3/kg)
s/h = seconds per hour
Q/Cwind = Inverse of the ratio of the geometric mean air concentration to the emission flux at the center of a square source (g/m^3-s per kg/m^3)
V = fraction of vegatative cover (unitless)
U_m = mean annual windspeed (m/s)
U_t = equivalent threshold value of windspeed at 7m (m/s)
F(x) = function dependent on U_m/U_t derived using Cowherd et al. (1985)
Site Area = 1.6 acres

Q/C_{wind} calculated in accordance with Exhibit D-2 from USEPA, 2002 using A, B, and C values for Huntington, WV:
$Q/C_{wind} = A*e\text{^}((\ln A_{site} - B)^2/C))$

Q/C_{wind}=	47.34	
A =	9.9253	unitless
B =	18.6636	unitless
C =	211.8862	unitless
A_{site}=	1.6	acres

Table E.1-4.3
PEF Calculations
Study Area at SWMU 13 RFI Report
Radford Army Ammunition Plant, Radford, Virginia

Construction Worker

Equation 5-5 from Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites. OSWER 9355.4-24. USEPA, 2002.

$$PEF_{sc} = Q / C_{sr} \cdot \frac{1}{F_D} \cdot \left[\frac{T \cdot A_R}{556 \cdot (W/3)^{0.4} \cdot \frac{(365\ d/yr - p)}{365\ d/yr} \cdot \sum VKT} \right]$$

Parameter	Value	
PEF_{sc}	1.23E+06	
Q/C_{sr}	19.04	calculated
F_D	0.185	default
T (sec)	7,488,000	assumed-see below
A_R (m^2)	491	calculated
W (tons)	8	assumed-see below
p (days/yr)	140	determined-see below
sumVKT (km)	608	assumed-see below

PEF_{sr} = subchronic road particulate emission factor (m^3/kg)

Q/C_{sr} = Inverse of the ratio of the 1-h geometric mean air concentration to the emission flux along a straight road segment bisecting a square site (g/m2-s per kg/m3)

F_D = dispersion correction factor (unitless)

T = total time over which construction occurs-total time period assumed to be 6 months (52wks x 5days per week x 8 hours per day x 3,600 s per hour)

A_R = surface area of contaminated road segment (m^2)

L_R = length of road segment (assumed to equal to (1.6 acres*43,560 ft^2/acre)$^{1/2}$)

W_R = width of road segment (assumed to be 20 ft)

$A_R = L_R \times W_R \times 0.092903 m^2/ft^2$

A_R= 491 m^2

W = mean vehicle weight assumed to be 8 tons ([(20 cars * 2 tons/car)+(10 trucks*20 tons/truck)]/30 vehicles)

p = number of days with at least 0.01 inches of precipitation (from Exhibit 5-2 140 days/year)

sumVKT = sum of fleet vehicle kilometers traveled during the exposure duration (km) (30 of vehicles x 0.078 km/day x 52wks x 5 days/wk)

Q/C_{sr} calculated in accordance with Equation 5-6:

using A, B, and C default values:

$Q/C_{sr} = A*e^{((\ln A_s - B)^2/C)}$

Q/C_{sr}=	19.04	g/m^2-s per kg/m^3
A =	12.9351	unitless
B =	5.7383	unitless
C =	71.7711	unitless
A_s =	1.6	acres

* Compounds are carcinogens that act via a mutagenic mode of action; therefore, carcinogenic risk for these compounds were calculated in accordance with "Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens" (USEPA 2005) and example calculations from "Derivation of RBCs for Carcinogens that Act Via a Mutagenic Mode of Action and Incorporate Default ADAFS" (USEPA 2006, Appendix E.3).

SUBJECT: Derivation of RBCs for Carcinogens that Act Via a Mutagenic Mode of Action and Incorporate Default ADAFs

FROM: Jennifer Hubbard, Toxicologist
Technical Support Branch (3HS41)

TO: RBC Table Users

DATE: October 19, 2006
*corrected November 8, 2006**

Because of the special considerations for carcinogens that act via a mutagenic mode of action, this memo includes a demonstration of the assumptions behind the Region III RBCs for those chemicals that incorporate the default age-dependent adjustment factors (ADAFs). A sample calculation for each medium is provided below.

On March 29, 2005, EPA Administrator Stephen Johnson provided general direction on implementing EPA's 2005 Guidelines for Carcinogen Risk Assessment and Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens. This was followed by an announcement in the April 7, 2005 Federal Register, and by the release of additional guidance documents concerning the implementation of the new cancer guidelines.

The aspect of the new guidelines that most directly affects Region III RBCs is the use of ADAFs to adjust cancer risk for receptors whose exposure includes early life. For chemicals that EPA has determined to be carcinogenic via a mutagenic mode of action, special adjustments are applied in estimating cancer risks. Vinyl chloride has a chemical-specific adjustment, described in its IRIS file. The impact of vinyl chloride's adjustment on Region III RBCs was discussed in the May 6, 2001 memo, "Derivation of Vinyl Chloride RBCs," found at http://www.epa.gov/reg3hwmd/risk/human/info/vcrbc.pdf. For the other chemicals, where no chemical-specific ADAFs have been developed, default ADAFs are used: 10 for age 0-2, 3 for age 2-16, and no adjustment for ages 16 and up. These chemicals are now marked with an "m" on the Region III RBC Table.

One example for each medium is provided below. The exposure factors are consistent with the defaults used in the other RBCs.

**The original October 19 version of this memo contained a typographical error in Section 2A: "mg/L" was used instead of "ug/L" for the concentration term in three of the equations. The units have now been corrected.*

SAMPLE EQUATIONS - RBCs

1. Soil, Residential

Sample Chemical: Benzo[a]pyrene
PRG = 0.022 mg/kg

Age 0-2

$$\frac{0.022 \text{ mg/kg} \times 200 \text{ mg/day} \times 350 \text{ days/yr} \times 2 \text{ yrs} \times 1\text{E-}6 \text{ kg/mg}}{365 \text{ days/yr} \times 70 \text{ yr} \times 15 \text{ kg}} \times \frac{7.3}{\text{mg/kg/day}} \times 10 = \mathbf{5.9E\text{-}7}$$

Age 2-6

$$\frac{0.022 \text{ mg/kg} \times 200 \text{ mg/day} \times 350 \text{ days/yr} \times 4 \text{ yrs} \times 1\text{E-}6 \text{ kg/mg}}{365 \text{ days/yr} \times 70 \text{ yr} \times 15 \text{ kg}} \times \frac{7.3}{\text{mg/kg/day}} \times 3 = \mathbf{3.5E\text{-}7}$$

Age 6-16

$$\frac{0.022 \text{ mg/kg} \times 100 \text{ mg/day} \times 350 \text{ days/yr} \times 10 \text{ yrs} \times 1\text{E-}6 \text{ kg/mg}}{365 \text{ days/yr} \times 70 \text{ yr} \times 70 \text{ kg}} \times \frac{7.3}{\text{mg/kg/day}} \times 3 = \mathbf{9.4E\text{-}8}$$

Age 16-30

$$\frac{0.022 \text{ mg/kg} \times 100 \text{ mg/day} \times 350 \text{ days/yr} \times 14 \text{ yrs} \times 1\text{E-}6 \text{ kg/mg}}{365 \text{ days/yr} \times 70 \text{ yr} \times 70 \text{ kg}} \times \frac{7.3}{\text{mg/kg/day}} \times 1 = \mathbf{4.4E\text{-}8}$$

Total Risk
5.9E-7 + 3.5E-7 + 9.4E-8 + 4.4E-8 = 1E-6

2. Tap water

Sample chemical = Dibromochloropropane (VOC)
PRG = 2E-4 ug/L

A. Ingestion risk

Age 0-2

$$\frac{0.0002 \text{ ug/L} \times 1 \text{ L/day} \times 350 \text{ days/yr} \times 2 \text{ yrs} \times 1\text{E-}3 \text{ mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 15 \text{ kg}} \times \frac{0.8}{\text{mg/kg/day}} \times 10 = \mathbf{2.9E\text{-}9}$$

Age 2-6

$$\frac{0.0002 \text{ ug/L} \times 1 \text{ L/day} \times 350 \text{ days/yr} \times 4 \text{ yrs} \times 1\text{E-}3 \text{ mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 15 \text{ kg}} \times \frac{0.8}{\text{mg/kg/day}} \times 3 = \mathbf{1.8E\text{-}9}$$

Age 6-16

$$\frac{0.0002 \text{ ug/L} \times 2 \text{ L/day} \times 350 \text{ days/yr} \times 10 \text{ yrs} \times 1\text{E-}3 \text{ mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 70 \text{ kg}} \times \frac{0.8}{\text{mg/kg/day}} \times 3 = \mathbf{1.9E\text{-}9}$$

Age 16-30

$$\frac{0.0002 \text{ ug/L} \times 2 \text{ L/day} \times 350 \text{ days/yr} \times 14 \text{ yrs} \times 1\text{E-3 mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 70 \text{ kg}} \times \frac{0.8}{\text{mg/kg/day}} \times 1 = \mathbf{8.8E\text{-}10}$$

Total Ingestion Risk

2.9E-9 + 1.8E-9 + 1.9E-9 + 8.8E-10 = 7.5E-9

B. Inhalation risk

Age 0-2

$$\frac{2\text{E-4 ug/L} \times 0.5 \text{ L/m}^3 \times 12 \text{ m}^3\text{/dy} \times 350 \text{ dy/yr} \times 2 \text{ yrs} \times 1\text{E-3 mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 15 \text{ kg}} \times \frac{21}{\text{mg/kg/day}} \times 10 = \mathbf{4.6E\text{-}7}$$

Age 2-6

$$\frac{2\text{E-4 ug/L} \times 0.5 \text{ L/m}^3 \times 12 \text{ m}^3\text{/dy} \times 350 \text{ dy/yr} \times 4 \text{ yrs} \times 1\text{E-3 mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 15 \text{ kg}} \times \frac{21}{\text{mg/kg/day}} \times 3 = \mathbf{2.8E\text{-}7}$$

Age 6-16

$$\frac{2\text{E-4 ug/L} \times 0.5 \text{ L/m}^3 \times 20 \text{ m}^3\text{/dy} \times 350 \text{ dy/yr} \times 10 \text{ yrs} \times 1\text{E-3 mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 70 \text{ kg}} \times \frac{21}{\text{mg/kg/day}} \times 3 = \mathbf{2.5E\text{-}7}$$

Age 16-30

$$\frac{2\text{E-4 ug/L} \times 0.5 \text{ L/m}^3 \times 20 \text{ m}^3\text{/dy} \times 350 \text{ dy/yr} \times 14 \text{ yrs} \times 1\text{E-3 mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 70 \text{ kg}} \times \frac{21}{\text{mg/kg/day}} \times 1 = \mathbf{1.2E\text{-}7}$$

Total Inhalation Risk

4.6E-7 + 2.8E-7 + 2.5E-7 + 1.2E-7 = 1E-6

Total Tap Water Risk

7.5E-9 + 1E-6 = 1E-6

3. Air

Sample chemical = Benzidine

A. Dose-Based Method (Using CSF in 1/mg/kg/day)

PRG = 1E-5 ug/m^3

Age 0-2

$$\frac{1\text{E-5 ug/m}^3 \times 12 \text{ m}^3\text{/day} \times 350 \text{ days/yr} \times 2 \text{ yrs} \times 1\text{E-3 mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 15 \text{ kg}} \times \frac{230}{\text{mg/kg/day}} \times 10 = \mathbf{5E\text{-}7}$$

Age 2-6

$$\frac{1\text{E-5 ug/m}^3 \times 12 \text{ m}^3\text{/day} \times 350 \text{ days/yr} \times 4 \text{ yrs} \times 1\text{E-3 mg/ug}}{365 \text{ days/yr} \times 70 \text{ yr} \times 15 \text{ kg}} \times \frac{230}{\text{mg/kg/day}} \times 3 = \mathbf{3E\text{-}7}$$

Age 6-16

$$\frac{1E\text{-}5\ ug/m^3 \times 20\ m^3/day \times 350\ days/yr \times 10\ yrs \times 1E\text{-}3\ mg/ug}{365\ days/yr \times 70\ yr \times 70\ kg} \times \frac{230}{mg/kg/day} \times 3 = \mathbf{2.7E\text{-}7}$$

Age 16-30

$$\frac{1E\text{-}5\ ug/m^3 \times 20\ m^3/day \times 350\ days/yr \times 14\ yrs \times 1E\text{-}3\ mg/ug}{365\ days/yr \times 70\ yr \times 70\ kg} \times \frac{230}{mg/kg/day} \times 1 = \mathbf{1.3E\text{-}7}$$

Total Risk

5E-7 + 3E-7 + 2.7E-7 + 1.3E-7 = 1E-6

B. Concentration-Based Method (Using IUR in m^3/ug).

PRG = 1.5E-5 ug/m^3

Age 0-2

$$\frac{1.5E\text{-}5\ ug/m^3 \times 350\ days/yr \times 2\ yrs}{365\ days/yr \times 70\ yr} \times \frac{0.067}{ug/m^3} \times 10 = \mathbf{2.8E\text{-}7}$$

Age 2-6

$$\frac{1.5E\text{-}5\ ug/m^3 \times 350\ days/yr \times 4\ yrs}{365\ days/yr \times 70\ yr} \times \frac{0.067}{ug/m^3} \times 3 = \mathbf{1.7E\text{-}7}$$

Age 6-16

$$\frac{1.5E\text{-}5\ ug/m^3 \times 350\ days/yr \times 10\ yrs}{365\ days/yr \times 70\ yr} \times \frac{0.067}{ug/m^3} \times 3 = \mathbf{4.1E\text{-}7}$$

Age 16-30

$$\frac{1.5E\text{-}5\ ug/m^3 \times 350\ days/yr \times 14\ yrs}{365\ days/yr \times 70\ yr} \times \frac{0.067}{ug/m^3} \times 1 = \mathbf{1.9E\text{-}7}$$

Total Risk

2.8E-7 + 1.7E-7 + 4.1E-7 + 1.9E-7 = 1E-6

Fish Tissue and Industrial Soil RBCs:
Because these RBC scenarios involve adults only, the ADAFs for early-life exposure do not apply. Therefore, these RBCs are derived in the traditional manner and are not shown in this memo.

LIST OF ABBREVIATIONS AND ACRONYMS

% ..... Percent
ADD..... Average Daily Dose
AF ..... Area Use Factor
BAF..... Bioaccumulation Factor
BTAG..... Biological Technical Assistance Group
BW ..... Body Weight
C_{TRV}..... NOAEL- or LOAEL-based TRV concentration
COPC ..... Chemical of Potential Concern
COPEC..... Chemical of Potential Ecological Concern
DF ..... Dietary Fraction
DW:WW ..... Dry weight to wet weight
ECO-SSL ..... Ecological Soil Screening Level
EF..... Extrapolation Factor
EPC ..... Exposure Point Concentration
HQ..... Hazard Quotient
IR ..... Ingestion Rate
kg ..... Kilogram
LD_{50}..... Lethal Dose to 50% of the test population
LOAEL ..... Lowest Observable Adverse Effects Level
MDC ..... Maximum Detected Concentration
mg ..... Milligram
mg/kg ..... Milligrams Per Kilogram
NOAEL..... No Observable Adverse Effects Level
ORNL..... Oak Ridge National Laboratory
PAH ..... Polynuclear Aromatic Hydrocarbon
SLERA..... Screening Level Ecological Risk Assessment
TOC ..... Total Organic Carbon
TRV ..... Toxicity Reference Value
UF ..... Uncertainty Factor
UF_{plant} ..... Plant Uptake Factor
USACHPPM..... U.S. Army Center for Health Promotion and Preventive Medicine
USEPA..... U.S. Environmental Protection Agency

1.0 INTRODUCTION

The purpose of this appendix is to present and describe development of exposure assessment models for the receptors presented in Section 7.0, the Screening Level Ecological Risk Assessment (SLERA) at SWMU 13 RFI Study Area. The following sections provide a summary of parameters used in the models and a detailed description of the direct contact and dose rate modeling approachs used in the SLERA. The complete SLERA for SWMU 13 RFI study area is presented in Appendix F.2.

2.0 MODEL PARAMETERS

The direct contact and dose rate models include parameters relating to receptor-specific exposure, chemical of potential concern (COPC) toxicity, and bioaccumulation rates. The following sections describe the estimation of these parameters and major assumptions of parameterization.

2.1 TOXICITY REFERENCE VALUES

MDCs for detected chemicals in soil are used as the preliminary exposure estimate to evaluate a conservative risk scenario for the direct contact pathway to soil invertebrates. Other potentially complete exposure pathways to soil invertebrate and microbial communities include direct ingestion of soil and biota. Due to insufficient information to quantify these pathways, likely secondary to the direct contact/absorption pathway, their omission should not substantially alter the risk characterization.

To evaluate the preliminary exposure estimates, the Toxicity Reference Values (TRVs) that were protective of terrestrial plants and soil invertebrate/microbial communities, were selected from a review of toxicological benchmarks for soil. TRVs for direct contact of soil to invertebrates/microbes and soil to plants were determined from the following guidance:

- USEPA Ecological Soil Screening Level (ECO-SSL): soil invertebrate and plant;
- Oak Ridge National Laboratory (ORNL): plant, microbial community, earthworm values (Efroymson *et al*. 1997a, Efroymson *et al*. 1997b, Efroymson *et al*. 1997c); and
- USEPA Region III Biological Technical Assistance Group (BTAG) soil screening values (USEPA 1995), BTAG freshwater screening benchmarks (USEPA 2006a), and BTAG freshwater sediment screening levels (USEPA 2006b)

Selected screening levels and sources are reported on Table F.2-5 for terrestrial plants and Table F.2-7 for soil invertebrates and microbial communities.

2.2 RECEPTOR-SPECIFIC EXPOSURE PARAMETERS

Wildlife receptors selected to characterize exposure at the SWMU 13 study area include:

- Herbivorous mammals: Meadow Vole (*Microtus pennsylvanicus*);
- Invertivorous mammals: Short-tailed Shrew (*Blarina brevicauda*);
- Invertivorous birds: American Robin (*Turdus migratorius*);
- Carnivorous birds: Red-tailed Hawk (*Buteo jamaicensis*); and
- Carnivorous mammals: Red Fox (*Vulpes vulpes*).

Exposure parameters used to derive TRV-based substrate concentrations for each receptor include body weight (kg), food ingestion rate (kg dry weight/day), dietary fraction, incidental substrate ingestion rate (kg dry weight/day), and area use factor. Both preliminary and refinement level exposure parameters are presented in Table F.2-9.

2.3 LITERATURE-BASED NOAEL AND LOAEL VALUES

The dose-response relationships for chemicals of potential concern are expressed as NOAELs and LOAELs for wildlife receptors, which are defined as a daily ingested amount (mg/kg body weight-day) that is associated with a specified effect. This process involves the determination of a "test species dose" for a critical endpoint from a particular experimental combination of exposure concentration, exposure duration, test species, and chemical. Endpoints may be based on growth, reproductive, developmental, and survival effects. Such effects are important because they may affect the abundance or reproductive success of receptor populations. The test-species dose from the selected study is then modified using extrapolation and uncertainty factors (EFs and UFs).

For this evaluation, EFs and UFs are used to modify laboratory study results, based on the methodology of Sample et al. (1996). This process involves the determination of a "test species dose" for a critical endpoint from a particular experimental combination of exposure concentration, exposure duration, test species, and chemical. The test-species dose from the selected study is then modified to account for the various extrapolations and uncertainties inherent in applying results from a controlled setting to an ecologically relevant setting, as in:

$$\text{NOAEL or LOAEL} = \frac{\text{Test-Species Dose}}{\text{Duration UF} \times \text{Endpoint UF}} \times \text{Body-Weight EF}$$

EFs and UFs are based on: (1) the duration of exposure, (2) the endpoint measured, and (3) differences in body weights among test and receptor species (Calabrese and Baldwin 1993, Ford et al. 1992, Opresko et al. 1994, Sample et al. 1996, USEPA 1996, Wentsel et al. 1994). EFs and UFs derivation and use is described in the following subsections. The use of surrogate chemical data is also discussed. NOAEL and LOAELs for COPCs are summarized in Table F.2-10.

2.3.1 The Test-Species Dose

Critical toxicological values are identified from carefully qualified primary and secondary literature references. The selection of particular studies and endpoints used for the derivation of NOAELs and LOAELs is based on the evaluation of the applicable studies and the dose-response data contained therein. In cases where preferred toxicological endpoints are not available, other toxicity values are used, but additional uncertainty factors may be incorporated. All toxicological values chosen for NOAEL and LOAEL derivation are presented on a mg chemical per kg body weight per day (mg/kg BW-day) basis. These units allow comparisons among organisms of different body sizes (Sample et al. 1996).

2.3.2 Duration Uncertainty Factors

Exposure durations of interest include (1) chronic, (2) subchronic, and (3) acute. Chronic studies occur over the lifetime or a majority of the lifespan of the test organism, generally longer than one year for mammals and 10 weeks for birds. Additionally, studies in which the test organism is dosed during a critical life stage (e.g., gestation) are included with chronic duration studies. Subchronic studies include exposures of two weeks to one year in duration that do not occur during a critical life stage. Acute studies typically have exposures of less than two weeks. NOAELs and LOAELs are usually reported from chronic and subchronic studies, with acute studies often reporting LD_{50} levels (LD_{50}; doses corresponding to the overt expression of a serious adverse effect such as mortality in 50% of test animals). Test-species doses from chronic studies are used preferentially over data from acute and subchronic studies. In cases where chronic data are not available as test-species doses, studies involving less-than-chronic exposures are used to in NOAEL and LOAEL derivation with the addition of a duration uncertainty factor.

For this study, duration uncertainty factors are applied according to USACHPPM 2000:

- Subchronic NOAEL to Chronic NOAEL: 10
- Subchronic LOAEL to Chronic NOAEL: 20

- Subchronic LOAEL to Chronic LOAEL: 4
- Acute NOAEL to Chronic NOAEL: 30
- Acute LOAEL to Chronic NOAEL: 50
- Acute LOAEL to Chronic LOAEL: 10

2.3.3 Endpoint Uncertainty Factors

Additional UFs are used to account for uncertainties in extrapolation between effect- and no-effect levels. Specifically, a NOAEL test-species dose may be estimated from a LOAEL (or LD_{50}) value, or a LOAEL may be estimated from a LD_{50}.

Extrapolation from a LOAEL or LD_{50t} to a NOAEL: Consistent with USACHPPM 2000, a UF of 10 is used with chronic LOAEL values to estimate the chronic NOAEL, which is considered conservative (Sample et al. 1996, USEPA 1996). When a LOAEL value is not available, a LD_{50} is used, although chronic NOAELs may range from 1/10 to 1/10,000 of the corresponding acute LD_{50} value (Opresko et al. 1994). For this report, an uncertainty factor of 100 is used to estimate a NOAEL value from a LD_{50} value (USACHPPM 2000).

Extrapolation from an LD_{50} to a LOAEL: Consistent with USACHPPM 2000, an UF of 20 is used conservatively to estimate a LOAEL value from a LD_{50} value (USACHPPM 2000).

2.3.4 Body-Weight Extrapolation Factor

This extrapolation is accomplished using a body weight-scaling factor to account for differences in body size (Sample et al. 1996). Numerous studies have shown that many physiological functions such as metabolic rates and responses to chemicals are a function of body size for mammals. Smaller mammals have higher metabolic rates and are usually more resistant to chemicals because of more rapid rates of detoxification. It has been shown that the best measure of body size is one based on body surface-area, which can be expressed in terms of body weight raised to a fractional power (Opresko et al. 1994, Sample et al. 1996, USEPA 1980). Dosimetric differences between the mammalian test species and wildlife receptors are accounted for using:

$$\mathrm{NOAEL}_w = \mathrm{NOAEL}_t \times \left(\frac{\mathrm{BW}_t}{\mathrm{BW}_w} \right)^{0.25}$$

where:

$NOAEL_w$	= NOAEL for the mammalian wildlife receptor (mg/kg BW-day)
$NOAEL_t$	= NOAEL for the mammalian test species (mg/kg BW-day)
BW_t	= Test species body weight (kg)
BW_w	= Wildlife receptor body weight (kg)

Scaling factors may not be appropriate for avian interspecies extrapolations. Information has shown that adjustment factors based on body size for interspecies extrapolation among avian species range from 0.63 to 1.55 (Sample et al. 1996). Therefore, a body-weight extrapolation factor is not used to derive avian NOAELs and LOAELs.

Mammalian wildlife receptor body weights are presented on Table F.2-9 and laboratory test species body weights are presented on Table F.2-10.

2.4 BIOACCUMULATION FACTORS

Bioaccumulation factors (BAFs) provide quantitative indicators of the tendency for a chemical to partition into terrestrial organisms, relative to the concentrations present in terrestrial exposure media. Exposure-point concentrations of chemicals in terrestrial prey (soil invertebrates and small mammals) and terrestrial plants are estimated using BAFs derived from the literature. The derivation of BAFs is described for organic and inorganic chemicals in the following subsections.

2.4.1 Terrestrial Plants

Exposure-point concentrations of chemicals in terrestrial plants are estimated using soil-to-plant bioaccumulation factors (uptake factors for plants, UF_{plant}) derived from the literature. UF_{plant} values are used to estimate wet-weight chemical concentrations in terrestrial plants using the same equation for invertebrates and a dry weight to wet weight conversion factor assuming plants are 80% water (Salisbury and Ross 1992). Table F.2-11 presents the uptake factors for plants.

Organic Chemicals: Organic chemicals may enter the plant by partitioning from contaminated soil to the roots and then translocating throughout the plant via the xylem tissue. Most bioaccumulative, lipophilic organic chemicals partition to the epidermis of the root or adhere to soil particles and are not drawn into the inner root or xylem (Paterson et al. 1990). Uptake factors for estimating concentrations of organic chemicals in plant tissues are derived from the following equation:

$$UF_{plant} = 10^{[1.588-(0.578\times \log K_{ow})]}$$

where:

UF_{plant} = Plant uptake factor (kg soil, dry weight / kg plant, dry weight)

$\log K_{ow}$ = Logarithm of the octanol:water partition coefficient

This relationship is based on a linear regression of bioaccumulation factors for 29 organic chemicals (Travis and Arms 1988). The correlation coefficient for the regression is 0.73, indicating that a majority of the variability in bioaccumulation is explained by the log K_{ow}. UF_{plant} values are derived for organic chemicals using this equation.

Inorganic Chemicals: Concentrations of inorganic chemicals in plant tissues are estimated based on generalized soil-to-plant transfer coefficients reported in a literature review. The soil-to-plant transfer factors for inorganic chemicals are equivalent to UF_{plant} values for organic chemicals and represent the ratio of the dry weight concentrations in plant tissue to the dry weight concentration of the element in root-zone soils. Bechtel-Jacobs 1998 C_p regression equation: $C_p = e^{(slope*\ln(Cs) - intercept)}$

2.4.2 Terrestrial Prey

Organic Chemicals: BAFs for estimating concentrations of organic chemicals in prey tissues are derived from linear regression equations presented in Travis and Arms (1998) and Beyer and Stafford (1993). The dry weight to wet weight (DW:WW) conversion factor is 0.2 for soil invertebrates (kg soil invertebrate dry weight per soil invertebrate wet weight; assumes invertebrates are 80% water), based on data reported in USEPA (1993). No DW:WW conversion factor was applied for small mammals. The BAF values used in to estimate concentrations of organic chemicals in soil invertebrates and small mammals are shown in Tables F.2-12 and F.2-13.

Inorganic Chemicals: Inorganic bioaccumulation factors for terrestrial prey (Table F.2-13) are wet-weight-based and are used to predict concentrations in invertebrates and small mammals according to:

$$BAF_{si} = C_{si} / C_{soil}$$

where:

BAF_{si} = Soil invertebrate uptake factor for inorganic chemicals

C_{si} = Chemical concentration predicted in soil invertebrates (mg chemical / kg soil invertebrate, dry weight)

C_{soil} = Concentration of inorganic chemical in soil (mg chemical / kg soil, dry weight)

3.0 DIRECT CONTACT APPROACH

3.1 PRELIMINARY DIRECT CONTACT TOXICITY EVALUATION

Risk is assessed by comparing the preliminary exposure estimate (maximum detected concetrations - MDC) of each detected chemical to the established TRV (detailed in Section 2.1). The preliminary risk is characterized in terms of a hazard quotient (HQ), which is expressed as:

HQ = MDC/TRV

where:

HQ = Hazard Quotient for the contaminant (unitless)
MDC = Maximum Detected Concentration for contaminant (mg/kg)
TRV = Screening Level for contaminant (mg/kg)

3.2 REFINED DIRECT CONTACT TOXICITY EVALUATION

For the refined evaluation, risk is assessed by comparing the exposure point concentration (EPC) of each detected chemical to the TRV (Section 7.1.6 details EPC development). The refined risk HQ is expressed as:

HQ = EPC/TRV

where:

HQ = Hazard Quotient for the contaminant (unitless)
EPC = Calculated Exposure Point Concentration for contaminant (mg/kg)
TRV = Screening Level for contaminant (mg/kg)

An HQ of less than 1 indicates no or negligible risk. The potential for risk increases as the HQ increases above unity. However, this result should be considered in the context of other characteristics of the exposure area.

Results of the direct contact toxicity evaluation are presented in Tables F.2-6 (terrestrial plants) and F.2-8 (soil invertebrates and microbial communities).

4.0 DOSE RATE MODELING APPROACH

A simplified food web model is utilized to calculate TRVs for each chemical and wildlife receptor. TRVs quantify COPC concentrations in exposure media that may result in no observable adverse effects or low observable adverse effects. The NOAEL corresponds to the greatest exposure associated with no observed adverse effects on growth, reproduction, or survival. The LOAEL corresponds to the smallest exposure associated with observed adverse effects on growth, reproduction or survival. TRVs developed by dose rate models are used to evaluate ecological effects associated with COPEC concentrations in exposure media.

4.1 PRELIMINARY DOSE RATE MODEL

Preliminary risk characterization for wildlife receptors uses the conservative preliminary exposure estimate and ecological effects evaluation to characterize risk to potential terrestrial receptors.

The simplified food web model considers the ingestion of prey, the incidental ingestion of media, and the primary routes of exposure to wildlife receptors. Chemical concentrations in prey are expressed as a function of chemical concentrations in exposure media using BAFs for terrestrial prey items. Other important parameters in the model include receptor body weight and an estimate of receptor use. As shown in the equation below, literature-derived NOAEL and LOAEL values are input into the model as the ADD variable to calculate the concentration in exposure media (C_{TRV}) that would result in a dose equivalent to a NOAEL or LOAEL.

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \ (BAF_{food} \cdot DF) + IR_s \ )AF}$$

where:

C_{TRV} = NOAEL or LOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg COPC/kg body weight-day)

BW = Minimum Body Weight of the receptor (kg)

IR_{food} = Maximum Ingestion Rate of food (kg food ingested per day, dry weight)

BAF_{food} = BAF of most contaminated dietary component used, specific to prey type and COPC (ratio of mg of COPC/kg fauna, wet weight to mg COPC/ kg substrate, dry weight)

DF = Dietary Fraction (most contaminated dietary component assumed to be 100% of diet)

IR_s = Maximum Incidental Ingestion Rate of soil (kg substrate ingested per day, dry weight)

AF = 100% Area Use Factor

Preliminary receptor parameters are presented on Table F.2-9. The resulting risk is characterized in terms of an HQ and is presented for wildlife receptors in Appendix F.2 and summarized in Table F.2-24.

4.2 REFINED EXPOSURE ESTIMATE AND RISK CHARACTERIZATION

The refined exposure and risk characterization, Step 3a of the ecological risk assessment guidance (ERAGS), reviews and refines the conservative assumptions used in the risk calculation (USEPA 1997). In Step 3a, conservative assumptions used in the preliminary exposure and risk characterization are replaced with more environmentally realistic assumptions to evaluate risk posed by COPECs identified in the preliminary risk characterization. The addition of Step 3a focuses the outcome of the ecological screening, streamlines the review process and functions as the initial basis for ecological risk management decision-making at each site.

4.3 REFINED DOSE RATE MODEL

This step replaces the conservative assumptions used in the preliminary exposure estimate and ecological effects evaluation with more environmentally realistic assumptions including the use of average body weight, average food and substrate ingestion rates, and the use of realistic area use factor, resulting in a more realistic estimate of potential risk.

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \ \sum \ (BAF_{food} \cdot DF) + IR_s \ )AF_{refined}}$$

where:

C_{TRV} = NOAEL or LOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg COPC/kg body weight-day)

BW = Average Body Weight of the receptor (kg)

IR_{food} = Average Ingestion Rate of food (kg food ingested per day, dry weight)

BAF_{food} = BAF of dietary component used, specific to prey type and COPC (ratio of mg of COPC/kg fauna, wet weight to mg COPC/ kg substrate, dry weight)

DF = Dietary Fraction

IR_s = Average Incidental Ingestion Rate of soil (kg substrate ingested per day, dry weight)

$AF_{refined}$ = Refined Area Use Factor (detailed below)

In the refined model, a realistic area use factor ($AF_{refined}$) was used to calculate the ratio of the study area (1.6 acres) to the average home range of the receptor:

$AF_{refined}$ = Study Area/Home Range Area

Other receptor parameters in the refined model remain conservative. The conservative assumptions are summarized as follows:

- Receptors assimilate 100% of COPECs detected in the food and soil; and
- Receptors forage in the site area 100% of the time.

Refined receptor parameters are presented on Table F.2-9. The resulting risk is characterized in terms of an HQ and is presented for wildlife receptors in Appendix F.2 and summarized in Table F.2-24.

4.4 EXAMPLE C_{TRV} EQUATION CALCULATION – PRELIMINARY AND REFINED

The following example C_{TRV} equation details the arsenic NOAEL-based screening level (SL) calculated for the short-tailed shrew at the SWMU 13 RFI study area (Tables F.2-16 and F.2-17) and resulting HQs:

Preliminary

- ADD = 0.15 mg/kg bw-day (NOAEL)
- BW = 0.0125 kg (minimum body weight)
- IR_{food} = 0.003 kg dw/day (maximum ingestion rate)
- BAF_{food} = 1.1 (for the most contaminated dietary component, in this case plant)
- DF = 1 (100% most contaminated dietary component in this case 100% plants)
- IR_{soil} = 0.00039 kg dw/day (maximum soil ingestion rate)
- AF = 1 (default used)

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}\ (BAF_{food} \cdot DF) + IR_s)AF} = \frac{0.15 \cdot 0.0125}{(0.003\,(1.1 \cdot 1) + 0.00039) \cdot 1} = \textbf{5.1E-01 mg/kg}$$

NOAEL HQ = MDC (mg/kg)/NOAEL-based SL (mg/kg) = $\frac{5.6}{5.1E-01}$ = **1.1E+01**

EPC NOAEL HQ = NOAEL HQ * (EPC (mg/kg) / MDC (mg/kg)) = 1.1E+01*($\frac{2.794}{5.6}$) = **5.5E+00**

Refined

- ADD = 0.15 mg/kg bw-day
- BW = 0.015 kg
- IR_{food} = 0.002 kg dw/day
- BAF_{plant} = 0.038
- BAF_{inv} = 0.179
- DF_{plant} = 0.14

- DF_{inv} = 0.86
- IR_{soil} = 0.00026 kg dw/day
- $AF_{refined}$ = 1

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF_{food}) + IR_s)AF}$$

$$= \frac{0.15 \cdot 0.015}{(0.002\,(0.038 \cdot 0.14 + 0.179 \cdot 0.86) + 0.00026) \cdot 1} = \textbf{3.9+00 mg/kg}$$

NOAEL HQ = EPC (mg/kg)/NOAEL-based SL (mg/kg) = $\frac{2.794}{3.9E+00}$ = **7.2E-01**

Table F.2-24 provides a summary of preliminary and refined HQs developed for terrestrial receptors at the SWMU 13 RFI study area.

5.0 SUMMARY

Receptor-specific exposure parameters are obtained from life history studies found in the literature. Important receptor-specific exposure parameters input into the model include: body weight, food ingestion rate, diet composition, incidental substrate ingestion rate, and area use factor.

The dose-response relationships for chemicals of potential interest are expressed as NOAELs and LOAELs for wildlife receptors, which are defined as a daily ingested amount (mg COPC/kg body weight-day) that is associated with a specified growth, reproductive, developmental, or survival effect. Extrapolation and uncertainty factors are applied to literature-based toxicological endpoints to account for differences in a controlled laboratory setting and an ecologically relevant setting. Extrapolation and uncertainty factors are based on: (1) the duration of exposure, (2) the endpoint measured, and (3) differences in body weights among test and receptor species.

Bioaccumulation accumulation factors provide quantitative indicators of the tendency for a chemical to partition into organisms, relative to the concentrations present in exposure media. Exposure-point concentrations of chemicals in terrestrial prey (soil invertebrates and small mammals) are estimated using several BAFs derived from the literature.

COPC concentrations in prey and media, receptor-specific exposure parameters, literature-based NOAEL and LOAEL values, and bioaccumulation factors are used in the model to calculate the concentration in exposure media (C_{TRV}) that would result in a dose equivalent to a NOAEL or LOAEL. The dose rate modeling approach is used to evaluate the potential mobility of COPCs through varying trophic associations.

Total 2,3,7,8-TCDD Equivalents (Mammalian)				2.281	
Total 2,3,7,8-TCDD Equivalents (Avian)				1.600	

Notes:
pg/g = Picogram Per Gram
ft bgs = Feet Below Ground Surface
TEF = Toxicity Equivalency Factor
LQ = Laboratory Qualifier
VQ = Validation Qualifier
r = Reason Code

Total 2,3,7,8-TCDD Equivalents are calculated by summing the detected concentration times the TEF for each chemical. Non-detects, R-flagged data, and B-flagged data are excluded from summed total.

Qualifiers:
J = Analyte present. Reported value may not be accurate or precise.
A = Amount detected below lower calibration limit

Notes:
kg = Kilogram
kg dw/day = Kilogram Dry-weight per Day
L/day = Liter per Day

[1]Wildlife Exposure Factors Handbook. U.S. Environmental Protection Agency (EPA). 1993. Office of Research and Development. 2 Volumes. EPA/600/R93/187a&b. December.
[2] Estimated food intake rate (kg [dw]/day) calculated as follows:
FI ((kg/day) = 0.0687 $Wt.^{0.882}$ for mammals (red fox and short-tailed shrew)
FI ((g/day) = 0.577 $Wt.^{0.727}$ for herbivores (meadow vole)
FI ((g/day) = 0.301 $Wt.^{0.751}$ for non-passerine birds (red-tailed hawk)
FI ((g/day) = 0.398 $Wt.^{0.850}$ for passerine birds (american robin)
[3]Estimating Exposure to Terrestrial Wildlife to Contaminants. Sample and Sutter. 1994. ES/ER/TM-125.
The soil ingestion rate for the american robin set equal to 38% of the american woodcock value (0.34*10.4%=4%), based on a robin diet of 38% invertbrates.

NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw/d = Body Weight Per Day
kg = kilogram
PAH = Polynuclear Aromatic Hydrocarbon
USACE = U.S. Army Corps of Engineers
ORNL = Oak Ridge National Laboratory
NOAEL and LOAEL values were derived from acute values by applying an uncertainty factor of 150.
LD_{50} = Lethal Dose for 50% of test organisms

[1] - Avian TRVs derived from subchronic NOAEL value of 1 and subchronic LOAEL value of 5 from a northern bobwhite and applying an uncertainty factor of 10 and 4 to derive NOAEL-based and LOAEL-based TRVs.
[2] - Used 2,4-dinitrotoluene avian TRVs as surrogate.
[3] - Avian chronic NOAEL TRV derived from subchronic NOAEL value of 26 from a northern bobwhite and applying an uncertainty factor of 10. Mammalian chronic NOAEL TRV derived from Chronic LOAEL value of 40 from a rat and applying an uncertainty factor of 5.
[4]- Mature rat body weight (average male & female) = 0.325 kg (U.S. EPA, 1988).
[5]- Mature Bobwhite Body Weight (seasonal average) = 0.191 kg (U.S. EPA, 1993).
[6]- Mature mouse body weight (female) = 0.035 kg (U.S.EPA, 1988).
[7]- Mature dog body weight (average male & female) = 14 kg (U.S. EPA, 1988).

Notes:

CAS = Chemical Abstract Services
C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)
ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.2-10
BW = Minimum Body Weigth of Receptor (kg)
IR_{food} = Maximum Ingestion Rate for Food
BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)
DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)
IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)
AF = 100% Area Use Factor
NOAEL = No observable adverse effects level
LOAEL = Lowest observable adverse effects level
mg/kg = Milligram Per Kilogram
bw - day = Body Weight - Day
HQ = Hazard Quotient
TRV = Toxicity Reference Value
EPC = Exposure Point Concentration

Meadow Vole Specific Data from Table F.2-9

BW=	0.017	kg
IR_{food} =	0.010	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00024	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Concentration
LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Concentration
EPC NOAEL HQ = NOAEL HQ * (EPC/Maximum Detected Concentration)

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soi)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.2-10

BW = Average Body Weigth of Receptor (kg)

IR_{food} = Average Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor, specific to prey type and chemical

DF = Dietary fraction

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

BDL = Below Detection Limit

EPC = Exposure Point Concentration

Meadow Vole Specific Data from Table F.2-9

BW=	0.037	kg
IR_{food} =	0.008	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{plants} =	1.00	unitless
IR_{soil} =	0.00019	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level

LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.2-10

BW = Minimum Body Weigth of Receptor (kg)

IR_{food} = Maximum Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)

DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = 100% Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

EPC = Exposure Point Concentration

Short-tailed Shrew Specific Data from Table F.2-9

BW=	0.0125	kg
IR_{food} =	0.003	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00039	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate soil screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Screening Level

LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Screening Level

EPC NOAEL HQ = NOAEL HQ * (EPC/Maximum Detected Concentration)

Table F.2-17

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.2-10

BW = Minimum Body Weigth of Receptor (kg)

IR_{food} = Maximum Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)

DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = 100% Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

EPC = Exposure Point Concentration

Red FoxSpecific Data from Table F.2-9

BW=	2.9500	kg
IR_{food} =	0.342	kg dw/day
BAF_{food}=	Chem Specific	unitless
IR_{soil} =	0.00960	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Screening Level

LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Screening Level

EPC NOAEL HQ = NOAEL HQ * (EPC/Maximum Detected Concentration)

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.2-10

BW = Average Body Weigth of Receptor (kg)

IR_{food} = Average Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor, specific to prey type and chemical

DF = Dietary fraction

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

BDL = Below Detection Limit

EPC = Exposure Point Concentration

American Robin Specific Data from Table F.2-9

BW=	0.0773	kg
IR_{food} =	0.016	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{plants} =	0.62	unitless
DF_{inv} =	0.38	unitless
IR_{soil} =	0.0008	kg dw/day
AF =	1.000	unitless

[a] = The following equation was used to calculate screening levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food} \sum (BAF_{food} \cdot DF) + (IR_s)) \cdot AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = EPC/Calculated NOAEL-Based Screening Level

LOAEL HQ = EPC/Calculated LOAEL-Based Screening Level

Notes:

CAS = Chemical Abstract Services

C_{TRV}= NOAEL-based screening level (mg chemical/kg soil)

ADD = NOAEL or LOAEL (mg chemical/kg body weight-day) from Table F.2-10

BW_i = Minimum Body Weigth of Receptor (kg)

IR_{food} = Maximum Ingestion Rate for Food

BAF_{food} = Bioaccumulation factor (Most contaminated dietary component BSAF used)

DF = Dietary fraction (Most contaminated dietary component assumed to be 100% of diet)

IRs = Incidental Ingestion Rate of soil (kg soil ingested per day, dry weight)

AF = 100% Area Use Factor

NOAEL = No observable adverse effects level

LOAEL = Lowest observable adverse effects level

mg/kg = Milligram Per Kilogram

bw - day = Body Weight - Day

HQ = Hazard Quotient

TRV = Toxicity Reference Value

EPC = Exposure Point Concentration

Red-tailed Hawk Specific Data from Table F.2-9

BW=	0.957	kg
IR_{food} =	0.063	kg dw/day
BAF_{food}=	Chem Specific	unitless
DF_{mam} =	1.00	unitless
IR_{soil} =	0.00	kg dw/day
AF =	1	unitless

[a] = The following equation was used to calculate screenning levels:

$$C_{TRV} = \frac{ADD \cdot BW}{(IR_{food}(BAF_{food} \cdot DF) + IR_s)AF}$$

See Appendix F.1 for an example C_{TRV} calculation.

NOAEL HQ = Maximum Detected Concentration/Calculated NOAEL-Based Concentration

LOAEL HQ = Maximum Detected Concentration/Calculated LOAEL-Based Concentration

EPC NOAEL HQ = NOAEL HQ * (EPC/Maximum Detected Concentration)

Ms. René Hypes, Project Review Coordinator
Division of Natural Heritage
Virginia Department of Conservation and Recreation
217 Governor Street
Richmond, VA 23219

Subject: Natural Heritage Project Review

Dear Ms. Hypes:

I am writing to request information concerning threatened and endangered species potentially inhabiting the area in the vicinity of an industrial site located near the town of Radford, VA. URS is performing an ecological risk assessment of the site. This information is needed to update information we received from a prior request (Invoice Number: H-3243, 4/10/03).

The site is located in the Valley and Ridge Province in western Montgomery County and eastern Pulaski County, VA. Land use surrounding the site is largely undeveloped due to steep terrain, although less rugged areas are primarily used for agriculture.

A portion of a topographic map (Radford North,VA quad) is attached which specifies the location of the site. Please perform a search of the area within a one-mile radius of this location and notify us of any threatened or endangered species and/or critical or protected habitats known to occur in this vicinity.

If you should have any questions concerning this request, please contact me at 215-542-3800. I thank you for your assistance in this matter.

Sincerely,

Dorcen LaPorta

Re: Industrial Site, Valley and Ridge in western Montgomery County

Dear Ms. LaPorta:

The Department of Conservation and Recreation's Division of Natural Heritage (DCR) has searched its Biotics Data System for occurrences of natural heritage resources from the area outlined on the submitted map. Natural heritage resources are defined as the habitat of rare, threatened, or endangered plant and animal species, unique or exemplary natural communities, and significant geologic formations.

According to the topographic map, this project either overlies or is adjacent to a karst landscape characterized by sinkholes, caves, disappearing streams, and large springs. The project has been sent to the Virginia Karst Program and to the Virginia Speleological Survey for review for documented sensitive karst features and caves. A significant cave has been documented in the project vicinity. Please coordinate with the Virginia Karst Program at 540-831-4056 (worndorff@dcr.state.va.us) to avoid, minimize, or mitigate impacts.

Our files also do not indicate the presence of any State Natural Area Preserves under DCR's jurisdiction in the project vicinity.

Under a Memorandum of Agreement established between the Virginia Department of Agriculture and Consumer Services (VDACS) and the Virginia Department of Conservation and Recreation (DCR), DCR represents VDACS in comments regarding potential impacts on state-listed threatened and endangered plant and insect species. The current activity will not affect any documented state-listed plants or insects.

New and updated information is continually added to Biotics. Please contact DCR for an update on this natural heritage information if a significant amount of time passes before it is utilized.

A fee of $ 95.00 has been assessed for the service of providing this information. Please find enclosed an invoice for that amount. Please return one copy of the invoice along with your remittance made payable to the Treasurer of Virginia, Department of Conservation and Recreation, 203 Governor Street, Suite 414, Richmond, VA 23219, ATTN: Cashier. Payment is due within thirty days of the invoice date.

Should you have any questions or concerns, feel free to contact me at 804-371-2708. Thank you for the opportunity to comment on this project.

Sincerely,

S. René Hypes
Project Review Coordinator

Re: Project #3348

Greetings:

The U.S. Fish and Wildlife Service (Service) has received your request to review the attached project for potential impacts to federally listed or proposed endangered and threatened species and designated critical habitat in Virginia pursuant to the Endangered Species Act (ESA) of 1973 (87 Stat. 884, as amended; 16 U.S.C. 1531 *et seq.*). Attached is a list of species with Federal status and species of concern that have been documented or may occur in the county where your project is located. This list was prepared by this office and is based on information obtained from previous surveys for rare and endangered species.

In order to ensure coordination with the State agencies, we consistently recommend that individuals contact the Virginia Department of Conservation and Recreation, Division of Natural Heritage **and** the Virginia Department of Game and Inland Fisheries, since each agency maintains a different database and has differing expertise and/or regulatory responsibility. You can contact these agencies at the following addresses:

Virginia Department of Game and Inland Fisheries
Environmental Services Section
P.O. Box 11104
Richmond, VA 23230
(804) 367-1000

Virginia Department of Conservation and Recreation
Division of Natural Heritage
217 Governor Street, 2nd Floor
Richmond, VA 23219
(804) 786-7951

If either of these agencies determines that your project may impact a federally listed, proposed, or candidate species OR federally designated critical habitat, please contact this office and provide a copy of the response letter from each agency and the above referenced project number; otherwise, further contact with this office is not necessary.

If you have any questions or need further assistance, please contact Ms. Jolie Harrison at (804) 693-6694, extension 208.

Sincerely,

Karen L. Mayne

1.0 INTRODUCTION

This document serves as the Annual Groundwater Monitoring Report for calendar year 2008 for the Open Burning Ground (OBG; also known as Hazardous Waste Management Unit [HWMU] 13) located at the Radford Army Ammunition Plant (Radford AAP) in Radford, Virginia. The Annual Groundwater Monitoring Report was compiled in accordance with the requirements specified in the *Permit for the Treatment of Hazardous Waste by Open Burning* (Permit) dated October 28, 2005. The Annual Groundwater Monitoring Report presents the following set of information: basic information and unit identification, a description of the groundwater monitoring plan, a discussion of groundwater movement, updated potentiometric maps, a table of groundwater elevations, and detailed statistical evaluations of the analytical data. The report evaluates the analytical data from two semiannual sampling events performed during calendar year 2008. Copies of field notes recorded during sample collection are included in **Appendix A**. The laboratory analytical results for the calendar year 2008 semiannual monitoring events are included in **Appendix B**.

The OBG is the waste propellant burning ground. Material that cannot be burned in the Explosive Waste Incinerators is open burned at this Unit. Groundwater monitoring activities for calendar year 2008 were conducted in accordance with the proposed *Groundwater Compliance Monitoring Plan* which is pending final review for incorporation into the Permit.

2.0 ANNUAL GROUNDWATER MONITORING REPORT

2.1 Waste Management Unit Information

Unit Name: Open Burning Ground (OBG)
(Hazardous Waste Management Unit 13 [HWMU-13])
Owner/Operator: United States Army/Alliant Techsystems Inc.

Unit Location: Radford AAP Horseshoe Area, Radford, Virginia

Class: Hazardous Waste Management Unit
Type: Waste Propellant Burning Ground

2.2 Groundwater Monitoring Plan

Monitoring Network
Upgradient Well: 13MW1, 13MW2
Point of Compliance Wells: 13MW3, 13MW4, 13MW5, 13MW6, 13MW7

Monitoring Status: Compliance Monitoring Program

CY 2008 Monitoring Events:
Second Quarter 2008: April 21-23, 2008
Fourth Quarter 2008: October 20-21, 2008

2.3 Groundwater Movement

The static water level measurements gathered at the OBG during the 2008 monitoring events are summarized in **Table 1**. Annual groundwater fluctuations ranged from 0.3 to 2.6 feet. As shown on the Potentiometric Surface Maps (**Figures 1** and **2**), groundwater movement beneath the site is generally to the south toward the New River.

For the purposes of this report, Darcian flow conditions were assumed for the alluvium and carbonate bedrock beneath the OBG. As a result, the groundwater velocities were calculated by multiplying the hydraulic conductivity (determined from previously conducted slug tests) by the average hydraulic gradient across the site and dividing by an assumed effective porosity for the aquifer materials. The average hydraulic gradient was determined by superimposing three evenly spaced flow line vectors over the Fourth Quarter 2008 Potentiometric Surface Map, measuring their lengths, calculating the head differential over the distances measured, and dividing the head differential by the length of the flow line vectors. The three calculated gradients were then averaged to a single value. Using this method, the average groundwater hydraulic gradient across the site based on Fourth Quarter 2008 groundwater elevations was calculated to be 0.002 ft/ft. Historical slug test data for the site yielded an average hydraulic conductivity of 6.56×10^{-5} ft/second, which is consistent with literature values for carbonate rock and for clayey, silty sand, and gravel alluvium (Domenico and Schwartz, 1990).

The estimated groundwater velocity across the site was calculated to be approximately 2.83×10^{-2} ft/day or 10.3 ft/year, based on the following:

- An average hydraulic conductivity of 6.56×10^{-5} ft/second.
- An average hydraulic gradient of 0.002 ft/ft.
- An assumed effective porosity of 0.40, based on a representative range of porosities for carbonate rock and clayey, silty sand and gravel alluvium (Domenico and Schwartz, 1990).

The actual groundwater flow velocities in the carbonate bedrock may vary as much as one to two orders of magnitude from the average velocity presented above depending on water level conditions and the distribution of secondary porosity.

2.4 2008 Groundwater Monitoring Activities

Radford AAP began semiannual Detection monitoring at the OBG after the Permit went into effect in October 2005. During Fourth Quarter 2005, carbon tetrachloride and perchlorate were detected at concentrations above their respective background concentrations, which prompted the need to develop a Compliance monitoring program. As a result, during First Quarter 2006, all wells were sampled for the constituents listed in Appendix IX of 40 CFR Part 264 to determine the Compliance Monitoring List. The hazardous constituents detected during the initial Appendix IX analysis formed the basis for the Compliance Groundwater Monitoring List for the Unit.

Groundwater monitoring activities for calendar year 2008 were conducted in accordance with the proposed *Groundwater Compliance Monitoring Plan* dated February 2007, including the annual monitoring of the point of compliance (POC) wells for the constituents listed in Appendix IX of 40 CFR Part 264. Copies of field notes recorded during sample collection activities are included in **Appendix A**. The groundwater analytical data for the calendar year 2008 semiannual monitoring events were evaluated in accordance with the procedures specified in the proposed *Groundwater Compliance Monitoring Plan*, including comparison to the proposed Groundwater Protection Standards (GPS). As the proposed *Groundwater Compliance Monitoring Plan* is pending final review for incorporation into the Permit, the groundwater analytical data for calendar year 2008 were also compared to the background concentrations for the OBG previously calculated in the *Constituent Background Values for the Compliance Groundwater Monitoring Program Constituents* dated December 20, 2006 (a copy of which is included in **Appendix C**).

2.5 Groundwater Analytical Data Evaluation

The groundwater samples collected during the calendar year 2008 events were analyzed for the constituents listed in Attachment V.B (Compliance Groundwater Monitoring List) of the proposed *Groundwater Compliance Monitoring Plan*. Additionally, the groundwater samples collected from the POC wells during Second Quarter 2008 were analyzed for the constituents listed in Appendix IX of 40 CFR Part 264. The constituents detected during the semiannual events and their corresponding concentrations, background values, and proposed GPS are listed

in **Table 2**. The laboratory analytical results for the calendar year 2008 semiannual monitoring events are included in **Appendix B**. The analytical data were validated in accordance with SW-846, *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review*, and *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*. Data validation reports are included in **Appendix B**. No data were rejected.

2.5.1 Second Quarter 2008

Total barium was detected in all monitoring wells; however, all concentrations were below their respective background concentrations and proposed GPS. Total zinc was detected in POC wells 13MW6 and 13MW7 at concentrations below the quantitation limit (QL); however, the detected total zinc concentrations were below background concentrations and the proposed GPS.

Total nickel was detected in POC well 13MW7 at a concentration of 292 µg/l, which was greater than the background concentration of 5 µg/l. However, the detected nickel concentration was below the proposed GPS for nickel of 313 µg/l.

Carbon tetrachloride was detected in POC well 13MW3 at a concentration of 4.3 µg/l, which was below the background concentration and proposed GPS of 5 µg/l.

Trichloroethene (TCE) was detected in POC wells 13MW4, 13MW6 and 13MW7 at concentrations of 1.5 µg/l, 1.2 µg/l and 1.1 µg/l, respectively. These concentrations were greater than the site-specific background concentration of 1 µg/l. However, detection of TCE in wells 13MW4 and 13MW7 is consistent with previous data, and the concentrations were below the proposed GPS of 5 µg/l.

Perchlorate was detected in POC well 13MW4 at a concentration of 81.9 µg/l, which was greater than the background concentration of 4 µg/l and the proposed GPS of 26 µg/l. This detection of perchlorate is consistent with previous data; however, due to the fact that the detected concentration is greater than the proposed GPS, Radford AAP is required to establish a Corrective Action Program for perchlorate that meets the requirements of 40 CFR Part 264.100. Radford AAP has submitted a Corrective Action Program for carbon tetrachloride and perchlorate, which is pending final review for incorporation into the Permit.

2.5.2 Fourth Quarter 2008

Total barium was detected in all monitoring wells; however, all concentrations were below the background concentration and proposed GPS.

Total nickel was detected in POC well 13MW7 at a concentration of 224 µg/l, which was greater than the background concentration of 5 µg/l. However, the detected nickel concentration was below the proposed GPS for nickel of 313 µg/l.

Total zinc was detected in upgradient wells 13MW1 and 13MW2 at concentrations of 26.3 µg/l and 39.9 µg/l, respectively, which were greater than the background concentration of 5 µg/l. However, the detected concentrations were below the proposed GPS for zinc of 4,695 µg/l.

Chloroform was detected in POC well 13MW3 at a concentration of 0.7 µg/l, which was below the background concentration of 1 µg/l and the proposed GPS of 80 µg/l.

TCE was detected in POC wells 13MW4 and 13MW7 at concentrations of 1.6 µg/l and 2.6 µg/l, respectively, which were greater than the background concentration of 1 µg/l. Additionally, TCE was detected in POC well 13MW3 at a concentration of 0.8 µg/l, which was below the background concentration of 1 µg/l. However, detection of TCE in these POC wells is consistent with previous data, and the concentrations were below the proposed GPS of 5 µg/l.

Carbon tetrachloride was detected in POC well 13MW3 at a concentration of 5.4 µg/l, which was greater than the background concentration and proposed GPS of 5 µg/l. In addition, perchlorate was detected in POC well 13MW4 at a concentration of 82.7 µg/l, which was greater than the background concentration of 4 µg/l and the proposed GPS of 26 µg/l. These detections of carbon tetrachloride and perchlorate are consistent with previous data; however, due to the fact that the detected concentrations are greater than their respective proposed GPS, Radford AAP is required to establish a Corrective Action Program for carbon tetrachloride and perchlorate that meets the requirements of 40 CFR Part 264.100. Radford AAP has submitted a Corrective Action Program for carbon tetrachloride and perchlorate, which is pending final review for incorporation into the Permit.

3.0 RECOMMENDATIONS

During the calendar year 2008 semiannual groundwater monitoring events, perchlorate was detected in POC well 13MW4 at concentrations greater than the proposed GPS of 26 µg/l. Additionally, carbon tetrachloride was detected in POC well 13MW3 at a concentration greater than the proposed GPS of 5 µg/l during Fourth Quarter 2008. As a result, Radford AAP is required to establish a Corrective Action Program for carbon tetrachloride and perchlorate that meets the requirements of 40 CFR Part 264.100. Radford AAP has submitted a Corrective Action Program for carbon tetrachloride and perchlorate, which is pending final review for incorporation into the Permit.

Radford AAP will continue to monitoring groundwater at the OBG in accordance with the *Groundwater Compliance Monitoring Plan* until the Corrective Action Program is approved and implemented, at which time groundwater monitoring will be conducted in accordance with the Corrective Action and Groundwater Monitoring Program.

Definitions: QL Denotes quantitation limit. **U** Denotes analyte not detected at or above QL. **UA** Denotes analyte not detected at or above adjusted sample QL. **J** Denotes analyte reported at or above QL and associated result is estimated due to quality control reasons. When used with "U" (i.e., "**UJ**"), denotes analyte not detected at or above QL and QL is estimated due to quality control reasons. When used with "UA" (i.e., "**UAJ**"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated due to quality control reasons. **R** Denotes result rejected. **Q** Denotes data validation qualifier. **NS** denotes not sampled. **NA** denotes not analyzed.

Note: First Quarter 2006 – Appendix IX monitoring event. For Appendix IX monitoring events, results reported to at or above the detection limit. Results between the detection limit and QL are considered unquantifiable and estimated. See laboratory deliverable for presentation of detection limits.
Second Quarter 2006 – First semiannual sampling event, includes perchlorate confirmation via MS.
Third Quarter 2006 – Additional sampling event – background data collection.
Fourth Quarter 2006 – Second semiannual sampling event.
Second Quarter 2007 - Appendix IX monitoring event. For Appendix IX monitoring events, results reported to at or above the detection limit. Results between the detection limit and QL are considered unquantifiable and estimated. See laboratory deliverable for presentation of detection limits.
Second Quarter 2008 - Appendix IX monitoring event. For Appendix IX monitoring events, results reported to at or above the detection limit. Results between the detection limit and QL are considered unquantifiable and estimated. See laboratory deliverable for presentation of detection limits.

Hexachlorophene analyzed and reported as a tentatively identified compound (TIC- First Quarter 2006).
For Dioxin results (Method 8280A), see laboratory report for sample specific QLs (All results, not detected).

GPS Denotes Groundwater Protection Standard. GPS proposed (not final).
Bis-e(ethylhexyl)phthalate QL is 10 ug/l for the Fourth Quarter 2007 event (>background and proposed GPS, 6 ug/l). For this event, results evaluated to the detection limit and no detections were reported.

APPENDIX B

2008 LABORATORY ANALYTICAL RESULTS
(CD-ROM)

APPENDIX C

ESTABLISHED BACKGROUND VALUES AND COMPUTATIONS

RADFORD ARMY AMMUNITION PLANT – OPEN BURNING GROUND CALCULATION OF CONSTITUENT BACKGROUND VALUES FOR THE DETECTION GROUNDWATER MONITORING PROGRAM

Draper Aden Associates calculated background values for each constituent listed in the Detection Groundwater Monitoring Program (DGMP) dated September 2003 for the Open Burning Ground located at the Radford Army Ammunition Plant (Radford AAP) in Radford, Virginia. With the exceptions of carbon tetrachloride, chlorobenzene, hexachloroethane, methyl chloride, methlyene chloride, and perchlorate, the background values for each constituent listed in the DGMP were calculated using the analytical data for upgradient wells 13MW1 and 13MW2 from First Quarter 1996 through First Quarter 2005. Groundwater monitoring for carbon tetrachloride, chlorobenzene, hexachloroethane, methyl chloride, methlyene chloride, and perchlorate began in Fourth Quarter 2003; therefore, the background values for those six constituents were calculated using the analytical data for upgradient wells 13MW1 and 13MW2 from Fourth Quarter 2003 through First Quarter 2005. The background value calculations were based on site-wide 95% confidence, 95% coverage upper prediction intervals. The calculated background values are listed in **Table 1**.

Background Data and Statistical Calculations

Statistical calculations of background values were performed using the analytical data from upgradient wells 13MW1 and 13MW2 as background data. Based on the percentage of non-detects and the distribution of the background data, methods of statistical calculations varied. Background average, standard deviation and other descriptive statistical data were computed for all constituents and are presented in **Appendix A**.

The constituents listed below were 100% non-detected (<LOQ) in the background wells. The background values for these constituents were established as equal to their quantitation limits (QL).

Background Value = Quantitation Limit (QL)				
Parameter	**Sample Size**	**% Non-Detects**	**QL (µg/l)**	**Background Value (µg/l)**
Acetone	74	100	25	25
Benzene	74	100	5	5
Carbon tetrachloride	12	100	5	5
Chlorobenzene	12	100	5	5
Methyl chloride	12	100	5	5
Methylene chloride	12	100	5	5
Toluene	74	100	5	5
2,4-Dinitrotoluene	74	100	10	10
Di-n-butylphthalate	74	100	10	10
Diethyl phthalate	74	100	10	10
Diphenylamine	74	100	10	10
Hexachloroethane	12	100	10	10
Nitroglycerine	74	100	10 mg/l	10 mg/l
Perchlorate	12	100	4	4
Nitrite	61	100	100	100

Non-parametric prediction intervals were computed for all of the constituents for which the data from upgradient wells 13MW1 and 13MW2 satisfied one of the following two criteria, per VDEQ regulations and guidance as well as USEPA guidance:

- Percentage of non-detects was greater than or equal to 50 and less than 100; or
- Percentage of non-detects was less than 50, but data was not normally distributed in original or log-transformed mode.

The background values for these constituents were set as equal to their upper prediction limits (UPLs), with one exception. For pH, a two-sided parametric prediction interval was computed; therefore, the background value for pH consists of a range between the lower prediction limit (LPL) and the UPL. The background and relevant statistical data for these constituents are summarized below. Associated statistical computations are presented in **Appendix A**.

Background Value = UPL of Non-parametric Prediction Interval Background Value for pH = LPL – UPL of two-sided Prediction Interval				
Parameter	**Sample Size**	**% Non-Detects**	**QL (µg/l)**	**Background Value (µg/l)**
Antimony	74	99	5	6
Arsenic	74	93	5	5
Chromium	74	31	5	112
Lead	74	69	5	14.0
Mercury	74	99	2	2.52
Silver	74	92	2	2.4
Total Phenols	74	97	5	20.0
Total Organic Carbon	74	73	1,000	10,600
Total Organic Halides	74	85	20	54.5
Sulfate	61	0	1,000	88,000
pH	62	0	0.1 pH units	5.72 – 7.80 pH units
Specific Conductivity	62	0	1 µS/cm	6,870 µS/cm

The following constituents exhibited normally or ln-normally distributed background data with less than 25% non-detects. One sided parametric prediction intervals were computed on the background data for each of these constituents. The background values for these constituents were set as equal to their UPLs. The background concentration calculations were based on a site wide 95% confidence, 95% coverage upper prediction intervals. When adjusted for multiple comparisons of the background data, the false positive rate was 5% (0.05). The background and relevant statistical data for these constituents are summarized below. The prediction interval computations for these constituents are presented in **Appendix A**.

Background Value = UPL of one-sided Prediction Interval				
Parameter	**Sample Size**	**% Non-Detects**	**QL (µg/l)**	**Background Value (µg/l)**
Barium	74	0	10	228
Nitrate	61	3	100	1,311

TABLE 1

OPEN BURNING GROUND
CALCULATED BACKGROUND VALUES

Constituent	Background Value (µg/l unless otherwise noted)
Antimony	6
Arsenic	5
Barium	228
Chromium	112
Lead	14.0
Mercury	2.52
Silver	2.4
Acetone	25
Benzene	5
Carbon Tetrachloride	5
Chlorobenzene	5
Methyl chloride	5
Methylene chloride	5
Toluene	5
2,4-Dinitrotoluene	10
Di-n-butylphthalate	10
Diethyl phthalate	10
Diphenylamine	10
Hexachloroethane	10
Nitroglycerine	10 mg/l
Perchlorate	4
Total Phenols	20.0
Nitrate	1,311
Nitrite	100
Sulfate	88,000
Total Organic Carbon	10,600
Total Organic Halides	54.5
Specific Conductivity	6,870 µS/cm
pH	5.72 – 7.80 pH units

APPENDIX A

OPEN BURNING GROUND
BACKGROUND VALUE STATISTICAL CALCULATIONS

RAAP - Open Burning Ground (HWMU-13) - Statistical Analysis - Background Calculation

May 10, 2005

1) Y2K Correction dates on GRITS/STAT software are as shown in the table below.

Actual Event Date	Date Used in Stat Software	Notes
1st Quarter 2000	12/10/1999	
2nd Quarter 2000	12/11/1999	
3rd Quarter 2000	12/12/1999	
4th Quarter 2000	12/13/1999	
1st Quarter 2001	12/14/1999	
2nd Quarter 2001	12/15/1999	
3rd Quarter 2001	12/16/1999	
4th Quarter 2001	12/17/1999	
1st Quarter 2002	12/18/1999	
2nd Quarter 2002	12/19/1999	
3rd Quarter 2002	12/20/1999	
4th Quarter 2002	12/21/1999	
1st Quarter 2003	12/22/1999	
2nd Quarter 2003	12/23/1999	
3rd Quarter 2003	12/24/1999	
4th Quarter 2003	12/25/1999	
1st Quarter 2004	12/26/1999	
2nd Quarter 2004	12/27/1999	
3rd Quarter 2004	12/28/1999	
4th Quarter 2004	12/29/1999	
1st Quarter 2005	12/30/1999	

2) No adjustments for multiple comparisons could be made for non-parametric UPLs and where UPL=QL.
Any Statistically significant increase (SSI) must be confirmed by verification sampling.

3) No data available for pH and Specific conductivity from 2nd Qtr 1996 - 2nd Qtr 1997.

4) Background for chlorobenzene, Carbon tetrachloride, Methyl Chloride (Chloromethane), Methylene Chloride (Dichloromethane), Hexachloroethane and Perchlorate based on 4th Quarter 2003 to 1st Quarter 2005 data.

5) Background for all other target constituents based on 1st Quarter 1996 through 1st Quarter 2005 data.

1.0 INTRODUCTION

This document is the 2007-2008 Annual Soil Monitoring Report for the Open Burning Ground (OBG) located at the Radford Army Ammunition Plant (RFAAP) in Radford, Virginia. This Annual Soil Monitoring Report summarizes activities conducted at the OBG from October 2007 through December 2008. The Annual Soil Monitoring Report was compiled in accordance with the requirements specified in *Soil Monitoring Program for the Open Burning Ground* (April 2005), which is included in the Final *Permit for the Treatment of Hazardous Waste by Open Burning* (effective date October 28, 2005).

This report presents background information for the OBG, a description of the permit requirements for soil sampling and reporting, sample collection and analytical methods, data validation results, and analytical results.

2.0 SITE BACKGROUND

RFAAP is located in the Valley and Ridge Physiographic Province in southwestern Virginia along the New River in Pulaski and Montgomery Counties and is divided into two sections by the river. The southern section, which comprises two-thirds of the facility, is known as the Main Plant. The northern one-third of the property, which includes the OBG, is known as the Horseshoe Area.

The OBG serves as the waste propellant burning ground for the RFAAP facility. Material that cannot be burned in the Explosive Waste Incinerators is burned at the OBG. The OBG is located within the 100-year floodplain of the New River at the southeastern end of the Horseshoe Area. The OBG is relatively flat and is located at an approximate elevation of 1,695 feet above Mean Sea Level (MSL). The site slopes steeply upward 75 to 100 feet north of the unit.

The geology at RFAAP consists of the Cambrian-aged Elbrook formation comprising limestone and dolomite with some shale and siltstone, covered by weathered residual deposits and/or alluvial deposits. The alluvial deposits have an average thickness of approximately 13 to 20 feet and consist of typical fluvial deposits of interbedded clay, silt, and sand/gravel deposits with lenses of cobbles. In portions of the site, the alluvial deposits and bedrock are separated by residual deposits, which consist of clay, silt, and clasts resulting from weathering of the parent bedrock. The residuum thickness on the site ranges from a few feet to up to 40 feet depending on the location.

The OBG is underlain by the Wheeling Silty Loam, which is characterized by low slopes. The unit includes a surface layer of approximately 10 inches of dark brown sandy loam underlain by 50 inches of dark brown gravelly sandy loam subsoil. At depths greater than 60 inches, the soil is predominantly a mixture of silt and sand with minor amounts of clay.

The general hydrogeologic setting for RFAAP is characterized by alluvial sediments overlying weathered and unweathered dolomite and limestone bedrock. In areas where alluvial sediments form the uppermost water-bearing zone, groundwater flow is generally from topographically high areas to topographically low areas. In some areas of the facility, the uppermost water-bearing zone is located within bedrock. Karst features within the bedrock aquifer can provide conduits for transport of groundwater to the New River, which is the discharge area for regional groundwater flow.

3.0 SOIL MONITORING PROGRAM REQUIREMENTS

The Soil Monitoring Program (SMP) was developed to monitor the OBG for potential effects to surface soils resulting from the facility operations. Implementation of the SMP will continue throughout the lifetime of the Resource Conservation & Recovery Act (RCRA) Operating Permit for the OBG facility. Currently, the SMP requires semiannual soil sampling at prescribed locations as shown on **Figure 1** in **Appendix A**.

As the SMP is designed to evaluate potential effects to the site by airborne deposition, soil sample collection targets the uppermost soil horizon. Sample locations were selected to represent the areas of greatest potential to be affected and are located between the burn pans of each burn pad. Each pad is defined as the area of raised topography that contains two individual burn pans. Burn pans are the ceramic or clay-lined vessels that hold waste propellant before and during the open burning process. The sample locations represent an area that will be subject to overlapping zones of ejecta from each pan. The ejecta zone is conservatively defined as 20 feet in all directions based on previous studies. The actual sample locations correspond to areas of low topography between each pan that function as the runoff conduit for the pad. These areas are erosion channels that flow toward the river-side berm and to the pond that precedes Outfall 017. The channels are not vegetated and are comprised of uncovered soils.

In addition to the eight samples collected adjacent to the burn pans (PAD 1-8), two discreet grab samples (SB-1 and SB-2) were collected along the southern boundary of the OBG along the New River. Two samples (NB-1 and NB-2) were also collected in the grassed median north of the burn pads. In addition, one grab sample (BERM-1) was collected at the southeast corner of the OBG inside the berm, and one sample (POND-1) was collected at the bottom of the sediment basin. According to the facility permit, if no constituents are detected at the additional monitoring locations (SB-1, SB-2, NB-1, NB-2, BERM-1, and POND-1) above their respective Action Limits (ALs), RFAAP may petition VDEQ to cease sampling at these additional locations.

In accordance with the SMP, the analytical results for the annual sampling event were compiled, evaluated, and interpreted upon receipt from the laboratory to determine whether concentrations of COPCs in soil are greater than the designated ALs. Analytical results from the January 2008 monitoring event were compared to the then current ALs. As stated in Section 3.2 of the SMP, the ALs may be updated on a bi-annual basis. As a result, RFAAP submitted a Class 1 Permit Modification to request a revision to the ALs in the SMP. The revised ALs were approved by VDEQ in a letter dated December 18, 2008. Analytical results from the November 2008 monitoring event were compared to the then current ALs as well as to the then proposed updated ALs as approved in the December 18, 2008 VDEQ correspondence.

The results of the data evaluation from the January 2008 and November 2008 semiannual events are summarized in this Annual Soil Monitoring Report.

4.0 SAMPLE COLLECTION

The semiannual soil sampling events for 2007-2008 were performed on January 7-8, 2008, and November 19 and 24, 2008, in accordance with the requirements of the OBG SMP. Approximate sample locations are shown on **Figure 1** in **Appendix A**.

Soil samples were collected from the uppermost six inches of soil using dedicated stainless steel tulip bulb samplers as described in the ASTM International (ASTM) *Standard Guide for Soil Sampling in the Vadose Zone, Designation D 4700-91* (reapproved 1998). Each sampler is labeled with the corresponding sample location.

Samples were collected from the lowest point in the swale between the pans at each burn pad. In order to determine the appropriate sample location, the center of each pan was located using a measuring tape. The lowest point in the swale was marked along a line connecting the centers of the burn pans. Samples were collected from the designated low point in accordance with the sample collection procedure outlined in the SMP. Also, grab samples were collected along the southern boundary of the OBG along the New River, in the grassed median north of the burn pads, at the southeast corner of the OBG inside the berm, and at the bottom of the sediment basin. For analytical quality assurance/quality control (QA/QC) purposes, a duplicate sample (PAD-X) was collected from PAD-7, and trip and equipment blanks were submitted. Copies of chains-of-custody (COCs) and field notes are included in **Appendix B**.

The dedicated samplers were cleaned prior to and following sample collection in accordance with equipment decontamination procedures outlined in the SMP. Equipment rinsate water generated during the sampling events was containerized and taken to the RFAAP Biological Wastewater Treatment Plant for disposal.

All samples were shipped in coolers under appropriate chain-of-custody. Sample coolers were shipped via overnight courier service to the analytical laboratory.

5.0 SOIL ANALYTICAL DATA EVALUATION

Soil samples collected during the semiannual sampling events were analyzed for the Constituents of Potential Concern (COPCs) as listed in the SMP and as shown on **Tables 1** and **2A/2B** in **Appendix C**. A copy of the COPC list from the SMP is included in **Appendix D**. Samples were analyzed using analytical methods set forth in U.S. Environmental Protection Agency (USEPA) *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods* (SW-846). All analyses were performed by TestAmerica North Canton (formerly Severn Trent Laboratory) of North Canton, Ohio, TestAmerica Austin of Austin, Texas, TestAmerica Knoxville of Knoxville, Tennessee, and TestAmerica West Sacramento of Sacramento, California. Laboratory analytical data were validated in accordance with the SMP.

The constituents detected at concentrations greater than their respective Permit-required reporting limits during the January 2008 semiannual event are summarized in **Tables 2A** and **2B** in **Appendix C**. Historical soil results are also included in **Tables 2A** and **2B**. The constituents detected at concentrations greater than their respective Permit-required reporting limits during the November 2008 semiannual event are summarized in **Tables 3A** and **3B**. Dioxin results are summarized in **Tables 4A** and **4B** in **Appendix C**. The complete laboratory certificates of analysis and data validation reports are included in **Appendix E**. As required by the permit, **Appendix E** also includes a list of analytes that were detected at concentrations between the Reporting Limit (RL) and the Limit of Detection (LOD).

During the January 2008 event, dioxin and lead were detected above the then current ALs at PAD-1, and mercury was detected above the then current AL at PAD-7. No other analytes were detected at concentrations above ALs. A verification event to confirm the initial results was performed on March 25, 2008. Dioxin and lead were present at concentrations below the ALs in the verification sample from PAD-1. The verification sample result for mercury at PAD-7 was greater than the AL.

An assessment of the horizontal extent of mercury in soil at PAD-7 was conducted on August 18, 2008, in general accordance with Section 7.4 of the SMP for the OBG (Permit Attachment II.C). This assessment was performed to evaluate the need to conduct Interim Measures as specified in Section 8.0 of the SMP.

On August 18, 2008, additional samples were collected in duplicate at the original PAD-7 sampling location and at approximately 20 feet to the north, south, east, and west of the original location. PAD-7 sampling locations are shown on **Figure 2** in **Appendix A**. The samples were sent to TestAmerica of North Canton, Ohio, and to CompuChem of Cary, North Carolina, for analysis for mercury. As shown in **Table 5** in **Appendix C**, both laboratories reported concentrations of mercury above the then current AL in samples collected at the PAD-7 original sampling location and at the north, south, and west sampling locations. In accordance with Section 7.4 of the SMP for the OBG, RFAAP was to submit a proposed Interim Measure Corrective Action Work Plan prepared in accordance with Section 8.0 of the SMP. However, the AL for mercury was updated from 0.13 mg/kg to 28 mg/kg as part of a Class I Permit Modification approved by VDEQ in a letter dated December 18, 2008. As concentrations of mercury at PAD-7 ranged from 0.30 to 2.20 mg/kg, RFAAP is not required to conduct further investigation of mercury detections at the OBG.

Analytical results from the November 2008 monitoring event were compared to the then current ALs as well as to the then proposed updated ALs as approved in the December 18, 2008 VDEQ correspondence. During the November 2008 event, no compounds were detected above either set of ALs at the OBG monitoring points.

Within the revised ALs presented in the December 18, 2008 correspondence, the VDEQ requested notification if 3,3-dimethylbenzidine is detected at concentrations less than the RL, since the RL for this analyte is above the updated AL due to instrument limitations. For the November 2008 monitoring event, the RL for 3,3-dimethylbenzidine at sample locations PAD-5 and PAD-6 was adjusted due to sample dilution required to accurately quantitate a result for another target analyte. 3,3-Dimethylbenzidine was not detected at concentrations less than the RL or the adjusted RL during the November 2008 monitoring event. 3,3-Dimethylbenzidine will continue to be monitored during future events. A summary of the adjusted RLs for 3,3-dimethylbenzidine is provided below.

Summary of 3,3-Dimethylbenzidine Adjusted Reporting Limits Above the Action Level Due to Sample Dilution

Location	Result	Adjusted RL	Adjusted Detection Limit	Action Level	Action Level Basis
3,3-Dimethylbenzidine					
PAD-5	ND	7 mg/kg	0.28 mg/kg	0.16 mg/kg	Region III RBC Industrial
PAD-6	ND	12 mg/kg	0.46 mg/kg	0.16 mg/kg	Region III RBC Industrial

Note: ND Denotes not detected at or above the adjusted detection limit or RL.

In addition, ten non-carcinogenic COPCs were detected during the January 2008 sampling event, and 11 non-carcinogenic COPCs were detected during the November 2008 event. These COPCs are analyzed for in accordance with the permit. Non-carcinogenic COPCs detected during the January 2008 event include: 1,3,5-trinitrotoluene, 2,4-dinitrotoluene, 2,6-dinitrotoluene, barium, bromomethane, cadmium, diethyl phthalate, di-n-butyl phthalate, nitrobenzene, and nitroglycerine. Non-carcinogenic COPCs detected during the November 2008 event include: 1,3,5-trinitrobenzene, 2,4-dinitrotoluene, 2,6-dinitrotoluene, 2-amino-4,6-dinitrotoluene, 4-amino-4,6-dinitrotoluene, barium, cadmium, diethyl phthalate, di-n-butyl phthalate, mercury, and nitroglycerine. Summaries of the non-carcinogenic COPCs detected during the January and November 2008 events are included in **Appendix F**.

Copies of correspondence notifying VDEQ of the results of soil sampling conducted at the OBG during the timeframe for this report are included as **Appendix G**.

6.0 CONCLUSIONS

Based on an evaluation of the soil analytical data for the OBG, no compounds were detected at concentrations above permit-specified updated ALs, approved on December 18, 2008, during the 2007-2008 soil monitoring events.

On August 9, 2007, RFAAP submitted a Class 3 permit modification that included modification to the soil monitoring program. In a letter dated October 31, 2007, the VDEQ indicated intent to approve the following modifications to the Permit:

- Decrease the sampling frequency from semiannual to annual.
- Remove the constituents antimony, benzoic acid, dibenzofuran, di-n-octyl phthalate, nickel, pyrene, and zinc from the list of COPCs.

The first monitoring event for 2008-2009 was performed in January 2009.

Pyrene	129-00-0	PIC		Yes		* Yes	8270C	3.30E-01	3.10E+04	3.10E+04	R3 RBC Ind
Zinc	7440-06-66	PIC		Yes		* Yes	6010B	2.50E+03	3.10E+05	3.10E+05	R3 RBC Ind

NOTES:

1. Type of Constituent - "Propellant Ingredient" = Ingredient in propellant compound.
   "PIC" Product of Incomplete Combustion": means that it was reported in the Bangbox Database (see Appendix A-2).
   "Both" Both PIC and Propellant Ingredient.
   "ENER" - Energetic on SW-846 Method 8330 parameter List.
2. In Waste- "Yes" - means it was reported in Radford AAP's waste characterization.
3. BOLD Constituent Constituent not in 40 CFR 261 Appendix VIII List of Hazardous Substances.
4. Dioxins Reporting Limit and Action Level will be calculated for each sample and detection, respectively. See Table 2 for example reporting format.
5. NCA Constituent is not analyzed by commercial laboratories.
6. Source of Action Levels - **"R3 RBC Ind"** - Region III RBC for Industrial Sites - Dated October 11, 2007.
   "R9 PRG Ind" - Region IX Preliminary Remediation Goals for Industrial Soils - Dated October 2004.
   "DEQ gd" - Table 5-5 Soil Saturation Values, Page 5-27 of VDEQ Storage Tank Program Technical Manual, Rev 3, October 4, 2001.
   "FWB" - Facility Wide Background Study.
   "ALM" is the Adult Lead Methodology (ALM). NHANES III (National Health and Nutrition Evaluation Survey) is a lead study. ALM identifies 800 mg/kg as a screening value and states that it is based on an analysis of the NHANES III study and that it is "a cleanup goal protective of all subpopulations."
   "ECO RISK" - June 23, 2000 EPA memorandum Entitled *Amended Guidance on Ecological Risk Assessment at Military Bases: Process Considerations, Timing of Activities and Inclusion of Stakeholders.*
7. RL and AL "RL" is the laboratory reporting limit and is analogous to the Limit of Quantitation (LOQ). "AL" is the Action Level based on published risk based values.

Notes:
X indicates sample was analyzed for corresponding analytical method.
Each method was performed for certain Constituents of Potential Concern (COPCs), which are listed on the COPC list included in Appendix D of this Annual Soil Monitoring Report.
A duplicate sample (PAD-X) of PAD-7 is collected for QA/QC purposes.

Definitions: QL Denotes limit of quantitation. **RL** Denotes reporting limit. **Q** Denotes data validation qualifier. **U** Denotes analyte not detected at or above QL/RL. **UA** Denotes analyte not detected at or above adjusted sample QL/RL. **J** Denotes analyte reported at or above QL/RL and associated result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not **detected** at or above QL/RL and QL/RL is estimated**.** When used with "UA" (i.e., "**UAJ**"), denotes analyte not detected at or above adjusted QL/RL and adjusted QL/RL is estimated. **R** Denotes result rejected. (-) Denotes not sampled. Action limit obtained from Permit (09/05) -Attachment 1II.C-23 and -24- OBG Soil Monitoring Program. Results for Method 8290 Dioxin/Furan submitted as a separate report.

See last page of this report for definitions.

Definitions: QL Denotes limit of quantitation. **RL** Detones reporting limit. **Q** Denotes data validation qualifier. **U** Denotes analyte not detected at or above QL/RL. **UA** Denotes analyte not detected at or above adjusted sample QL/RL. **J** Denotes analyte reported at or above QL/RL and associated result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not **detected** at or above QL/RL and QL/RL is estimated**.** When used with "UA" (i.e., "**UAJ**"), denotes analyte not detected at or above adjusted QL/RL and adjusted QL/RL is estimated. **R** Denotes result rejected. (-) Denotes not sampled. Action limit obtained from Permit (09/05) -Attachment 1II.C-23 and -24- OBG Soil Monitoring Program.

Definitions: **QL** Denotes limit of quantitation. **RL** Denotes reporting limit. **Q** Denotes data validation qualifier. **U** Denotes analyte not detected at or above QL/RL. **UA** Denotes analyte not detected at or above adjusted sample QL/RL. **J** Denotes analyte reported at or above QL/RL and associated result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not **detected** at or above QL/RL and QL/RL is estimated. When used with "UA" (i.e., "**UAJ**"), denotes analyte not detected at or above adjusted QL/RL and adjusted QL/RL is estimated. **R** Denotes result rejected. (-) Denotes not sampled. Action limit obtained from permit modification approved December 18, 2008. Results for Method 8290 Dioxin/Furan submitted as a separate report.

See last page of this report for definitions.

Definitions: **QL** Denotes limit of quantitation. **RL** Detones reporting limit. **Q** Denotes data validation qualifier. **U** Denotes analyte not detected at or above QL/RL. **UA** Denotes analyte not detected at or above adjusted sample QL/RL. **J** Denotes analyte reported at or above QL/RL and associated result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not **detected** at or above QL/RL and QL/RL is estimated. When used with "UA" (i.e., "**UAJ**"), denotes analyte not detected at or above adjusted QL/RL and adjusted QL/RL is estimated. **R** Denotes result rejected. (-) Denotes not sampled. Action limit obtained from permit modification approved December 18, 2008.

See last page of this report for definitions.

Notes: Analytical Method: SW-846 8290 -Test America West Sacramento, unless noted.

TEF Denotes USEPA Region 3 Toxicity Equivalence Factor based on WHO June 2005 values. (See www.epa.gov/reg3hwmd/risk/human/rb-concentration_table/usersguide.htm). TEF factors based on noted reference reflect current research.

2,3,7,8 - TCDD Toxicity Equivalence Quotient (TEQ) ng/kg. Calculated by summing the multiplication of detections by the respective TEF

LOQ/QL-Limit of Quantitation/sample specific reporting limit. See analytical results for sample specific reporting limit.

Data Qualifiers:

U denotes not detected. See certificate of analysis for sample specific estimated detection limit.

J Denotes result reported below LOQ/Quantitation Limit.

JA Denotes result positively identified, but quantitation is estimated.

JQ (laboratory data qualifier) Denotes result estimated maximum possible concentration reported

ND (Laboraory data qualifier) denotes analyte not detected above estimated detection limit and constituent specific TEQ was not calculated.

Verification event performed on 3/25/2008 for PAD-1 (DUP-1). Verification results reported (Test America Knoxville).

PAD-X is a blind duplicate for PAD-7. " Val Flag" denotes data validation data qualifier. "Lab Flag" denotes Laboratory data qualifier.

Notes: Analytical Method: SW-846 8290 -TestAmerica West Sacramento, unless noted.

TEF Denotes USEPA Region 3 Toxicity Equivalence Factor based on WHO June 2005 values. (See www.epa.gov/reg3hwmd/risk/human/rb-concentration_table/usersguide.htm). TEF factors based on noted reference reflect current research.

2,3,7,8 - TCDD Toxicity Equivalence Quotient (TEQ) ng/kg. Calculated by summing the multiplication of detections by the respective TEF

LOQ/QL-Limit of Quantitation/sample specific reporting limit. See analytical results for sample specific reporting limit.

Data Qualifiers:

U denotes not detected. See certificate of analysis for sample specific estimated detection limit.

J Denotes result reported below LOQ/Quantitation Limit.

JA Denotes result positively identified, but quantitation is estimated.

JQ (laboratory data qualifier) Denotes result estimated maximum possible concentration reported.

ND (Laboratory data qualifier) denotes analyte not detected above estimated detection limit and constituent specific TEQ was not calculated.

CON denotes confirmation analysis. H denotes OCDD/F reported from separate analytical analysis.

PAD-X is a blind duplicate for PAD-7.

"Val Flag" denotes data validation data qualifier. "Lab Flag" denotes Laboratory data qualifier.

Table 5 - Analytical Results for Soil Samples – PAD-7 Mercury
Open Burning Ground - Soil Monitoring Program

Sample ID	Result mg/kg	RL mg/kg	Action Limit mg/kg	Updated Action Limit mg/kg
January 7, 2007 Result				
PAD-7	0.3	0.1	0.13	28
March 25, 2008 Result				
PAD-7	0.34	0.1	0.13	28
August 18, 2008 Result (TestAmerica)				
PAD-7 (Center/Original Pt.)	2.2*	0.22	0.13	28
PAD-7 (North)	1.9	0.13	0.13	28
PAD-7 (South)	0.2	0.14	0.13	28
PAD-7 (West)	0.21	0.12	0.13	28
PAD-7 (East II)	U	0.12	0.13	28
August 18, 2008 Result (CompuChem)				
PAD-7 (Center/Original Pt.)	0.34	0.1	0.13	28
PAD-7 (North)	1.1	0.1	0.13	28
PAD-7 (South)	0.12	0.1	0.13	28
PAD-7 (West)	0.18	0.1	0.13	28
PAD-7 (East II)	NA	0.1	0.13	28

Notes:
Original Action Limit based on Facility Wide Background Study. Action Limit was updated by a Class I Permit Modification approved by VDEQ in a letter dated December 18, 2008. Updated Action Limit based on Region 3 Risk-Based Concentrations (RBCs) dated September 12, 2008.
Sample results reported on a dry weight basis.
RL – Reporting Limit. Also may be referenced as Quantitation Limit (QL) or Limit of Quantitation (LOQ).
* – Sample diluted 1:2. The result for the sample duplicate (CompuChem Lab) was 0.3 mg/kg.
U – Mercury was not detected above the RL.
NA – Sample was not analyzed.

NOTES:

1. Type of Constituent -
   - "Propellant Ingredient" = Ingredient in propellant compound
   - "PIC" Product of Incomplete Combustion": means that it was reported in the Bangbox Database (see Appendix A-2)
   - "Both" Both PIC and Propellant Ingredient
   - "ENER" - Energetic on SW-846 Method 8330 parameter List
2. In Waste-
   - "Yes" - means it was reported in Radfords' waste characterization
3. **BOLD** Constituent
   - Constituent not in 40 CFR 261 Appendix VIII List of Hazardous Substances
4. Dioxins
   - Reporting Limit and Action Level will be calculated for each sample and detection, respectively. See Table 2 for example reporting format.
5. NCA
   - Constituent is not analyzed by commercial laboratories
6. Source of Action Levels -
   - **"R3 RBC ind"** - Region III RBC for Industrial Sites - Dated 10/8/2004
   - **"R9 PRG ind"** - Region IX Preliminary Remediation Goals for Industrial Soils - Dated October 2004
   - **"DEQ gd"** - Table 5-5 Soil Saturation Values, Page 5-27 of VDEQ Storage Tank Program Technical Manual, Rev 2, May 3, 1999
   - **"FWB"** - Facility Wide Background Study
   - **"ALM"** is the Adult Lead Methodology (ALM). NHANES III (National Health and Nutrition Evaluation Survey) is a lead study. ALM identifies 800 mg/kg as a screening value and states that it is based on an analysis of the NHANES III study and that it is "a cleanup goal protective of all subpopulations."
   - **"ECO RISK"** - June 23, 2000 EPA memorandum Entitled *Amended Guidance on Ecological Risk Assessment at Military Bases: Process Considerations, Timing of Activities and Inclusion of Stakeholders.*
7. RL and AL
   - "RL" is the laboratory reporting limit and is analogous to the Limit of Quantitation (LOQ). "AL" is the Action Level based on published risk based values.

APPENDIX E

LABORATORY CERTIFICATES OF ANALYSIS AND DATA VALIDATION REPORTS (CD-ROM)

Draper Aden Associates
Engineering • Surveying • Environmental Services
www.daa.com

Data Validation Summary
First Quarter 2008 Soil Monitoring Event

Soil Monitoring Program for the Open Burning Ground (OBG)
Radford Facility Army Ammunition Plant, Radford, Virginia
Permit for the Treatment of Hazardous Waste by Open Burning
EPA ID# VA1210020730

Draper Aden Associates performed comprehensive data validation of the analytical results for the January 2008 soil monitoring event at the Open Burning Ground (OBG) located at the Radford Facility Army Ammunition Plant (RFAAP) in Radford, Virginia.

Results from the January 2008 soil monitoring event were compared to the then current Action Level for each target analyte (constituents) listed Table 1, in Attachment II.C-24 of the operating permit. For the January 2008 monitoring event, mercury was reported above the then current Action Level and subsequent additional monitoring was conducted to further assess the reported mercury detection.

However, a permit modification was submitted to VDEQ in December 2008 to update the Action Levels, where applicable, to the new Action Levels established in the September 2008 Environmental Protection Agency Regional Screening Table developed by Oak Ridge Laboratory. VDEQ approved the requested permit modification on December 18, 2008. Since the Action Level for mercury was revised from 0.13 mg/kg to 28 mg/kg, no further action regarding the reported mercury concentrations in the January 2008 soil monitoring event was required.

The information below summarizes the January 2008 soil monitoring event data validation.

Sample Collection/Analytical Services

Draper Aden Associates of Blacksburg, Virginia collected soil samples during January 7-8, 2008 from sample locations PAD-1 through PAD-8, NB-1, NB-2, SB-1, SB-2, BERM-1 and POND-1.

Samples were submitted for laboratory analysis via overnight courier to TestAmerica North Canton, of North Canton, Ohio. Samples were analyzed for target analytes listed in Table 1 in Attachment II.C-24 of the operating permit. Samples were analyzed for volatiles, semivolatiles, explosives, nitroglycerin, inorganics, mercury and dioxin/furans by SW-846 Methods 8260B/5035, 8270C, 8330, 8332, 6010B, 7471A and 8290, respectively. Samples PAD-1, PAD-4 and PAD-7 were also analyzed for Total Petroleum Hydrocarbons-Diesel Range Organics (TPH-DRO) by Method 8015B. As well, all samples were analyzed for total residue as percent solids by MCAWW 160.3 MOD.

Sample PAD-7 was selected as the blind field sample duplicate and project specific matrix spike and matrix spike duplicate sample for all methods of analysis. The blind sample duplicate

sample identification was PAD-X. A trip blank was submitted for volatile organic analysis (Method 8260B). An equipment blank (water sample) was submitted for inorganic analysis only (Methods 6010B and 7470A).

TestAmerica North Canton submitted select sample aliquots for analysis to TestAmerica Austin, Austin, Texas (Method 8260B), TestAmerica Knoxville of Knoxville, Tennessee (Method 8330 and 8332) and TestAmerica West Sacramento of Sacramento, California (Method 8290). On behalf of Alliant Techsystems Inc., the laboratory submitted the certificate of analysis to Draper Aden Associates for data validation as a single sample delivery group, (SDG) A8A110170.

Monitoring Program Notes

Benzyl chloride was analyzed by SW-846 8260B and 3,3-dimethylbenzidine was analyzed by Method 8270C. Although listed as a target analyte (constituent of concern) on Table 1, Attachment II.C-24, of the operating permit, previously, these target analytes could not be analyzed by the laboratory. The laboratory submitted the method detection limit study for these two target analytes prior to analysis.

The analyst initial demonstration of capability data was not received from the laboratory. According to the laboratory, the information is on file at the laboratory. The omission of this information did not result in data qualification. The information will be requested with future sampling events.

Receipt of Monitoring Event Data

The original certificate of analysis for the event was received on February 22, 2008. Subsequent revisions were received from the laboratory. The revisions were associated with missing supporting documentation.

Verification Events

Verification sampling was conducted on March 25, 2008 to confirm or refute detections of concern reported for the January 2008 monitoring event (lead, mercury and dioxin/furan). The samples were collected in duplicate and submitted as split samples to Test America (Knoxville, North Canton and West Sacramento) and ProChem Analytical, Inc., of Elliston, Virginia. Verification results were less than the respective Action Level, except for mercury reported at PAD-7 above the then current Action Level in place prior to December 2008.

An assessment of horizontal extent of mercury in soil at PAD-7 was conducted on August 18, 2008. The samples were collected in duplicate and submitted as split samples to CompuChem, a Division of Liberty Analytical, Cary, North Carolina and Test America North Canton, North Canton, Ohio.

See the *2008 Annual Soil Monitoring Report* for additional information regarding the verification event and assessment of horizontal extent at PAD-7. As previously noted, in December 2008, VDEQ approved a permit modification revising the Action Level for mercury and no further action regarding reported mercury concentrations was required.

Summary of OBG Soil Sample Locations and Required Analytical Methods

Laboratory Analysis

Samples were analyzed by *SW-846 Method requirements (Test Methods for Evaluating Solid Wastes - Physical and Chemical Methods, USEPA SW-846, 3rd edition - Final Update I, II/IIA and III).*

Data Validation

Data were evaluated in general accordance with:

- *Test Methods for Evaluating Solid Wastes - Physical and Chemical Methods*, USEPA SW-846, 3rd edition - Final Update I, II/IIA and III)
- *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review*, October 1999
- *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, October 2004
- *USEPA Contract Laboratory Program National Functional Guidelines for Chlorinated Dioxin/Furan Data Review*, September 2005

Draper Aden Associates, of Blacksburg, Virginia, performed comprehensive data validation, including recalculation of 10% of the data, except where noted. A summary table of data validation results is provided as an attachment. The comprehensive data validation report for each analytical method is provided on CD ROM in Appendix E. No results were rejected.

Reporting of Results

As required by the permit, the laboratory reported results at or above the method detection limit (MDL) for the target analytes (constituents) listed Table 1, in Attachment II.C-24 of the operating permit. Detections between the MDL and reporting limit (RL) are considered estimated concentrations and the validated result was qualified with a "J" flag. Target analytes not detected at or above the MDL or RL are validated and qualified with a "U" flag, unless further data qualification was required based on data validation. Results are reported on a dry weight basis.

Method 8290 Dioxin/Furan reporting: The laboratory reports results on a dry weight basis to the estimated detection limit (EDL) for each isomer. The laboratory reports results between the EDL and sample specific reporting limit as estimated and the result was flagged "J." As per the operating permit, only concentrations above the sample specific reporting limit were used in the 2,3,7,8-TCDD Toxicity Equivalent Quotient (TEQ) calculation. TEQ calculations are submitted as an attachment.

Summary of Results

No results were rejected.
Mercury was reported above the then current Action Level at PAD-7 in January 2008. The Action Level for mercury was subsequently revised in December 2008 and no further action regarding reported mercury concentrations was required. The January 2008 soil monitoring data was compared to the Action Levels in place prior to December 2008.

Accuracy

Accuracy was evaluated using the percent recovery obtained from the laboratory control sample (LCS), matrix spike and matrix spike duplicate (MS/MSD) samples, and the surrogate spike. LCS and MS/MSD recoveries were within the acceptance criteria, except where noted on the attached data validation report.

Precision

Precision was evaluated using the relative percent difference (RPD) data obtained from the MS/MSD and sample/blind field duplicate results. For metals, a control limit of 60 RPD was used due to expected and observed soil variability. For all other sample/blind field duplicate results, a control limit of <35% RPD and 2x the RL/QL was used, where applicable.

MS/MSD RPD criteria were within acceptance criteria, except where noted on the attached data validation report. Sample/blind field duplicate RPD criteria was met except where noted on the attached data validation report.

Completeness

Completeness was evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. Valid analytical data are results not qualified as rejected.

All results were accepted. The completeness for the data set is 100%.

Representativeness

Representativeness. Data collected at the site met accuracy and precision requirements, except where noted. Samples were collected using standardized procedures. Samples were analyzed using standardized, accepted analytical methods using traceable standard to ensure that accurate and reproducible data were generated. None of the data required qualification for exceeding holding time requirements. Data from the January 2008 monitoring event were considered representative.

Notes: Analytical Method: SW-846 8290 -Test America West Sacramento, unless noted.

TEF Denotes USEPA Region 3 Toxicity Equivalence Factor based on WHO June 2005 values. (See www.epa.gov/reg3hwmd/risk/human/rb-concentration_table/usersguide.htm). TEF factors based on noted reference reflect current research.

2,3,7,8 - TCDD Toxicity Equivalence Quotient (TEQ) ng/kg. Calculated by summing the multiplication of detections by the respective TEF

LOQ/QL-Limit of Quantitation/sample specific reporting limit. See analytical results for sample specific reporting limit.

Data Qualifiers:

U denotes not detected. See certificate of analysis for sample specific estimated detection limit.

J Denotes result reported below LOQ/Quantitation Limit.

JA Denotes result positively identified, but quantitation is estimated.

JQ (laboratory data qualifier) Denotes result estimated maximum possible concentration reported

ND (Laboraory data qualifier) denotes analyte not detected above estimated detection limit and constituent specific TEQ was not calculated.

Verification event performed on 3/25/2008 for PAD-1 (DUP-1). Verification results reported (Test America Knoxville).

PAD-X is a blind duplicate for PAD-7. " Val Flag" denotes data validation data qualifier. "Lab Flag" denotes Laboratory data qualifier.
