DRAPER ADEN ASSOCIATES PREPARED THIS DOCUMENT (WHICH MAY INCLUDE DRAWINGS, SPECIFICATIONS, REPORTS, STUDIES AND ATTACHMENTS) IN ACCORDANCE WITH THE AGREEMENT BETWEEN DRAPER ADEN ASSOCIATES AND ALLIANT TECHSYSTEMS INC.

THE STANDARD OF CARE FOR ALL PROFESSIONAL ENGINEERING, ENVIRONMENTAL AND SURVEYING AND RELATED SERVICES PERFORMED OR FURNISHED BY DRAPER ADEN ASSOCIATES UNDER THIS AGREEMENT ARE THE CARE AND SKILL ORDINARILY USED BY MEMBERS OF THESE PROFESSIONS PRACTICING UNDER SIMILAR CIRCUMSTANCES AT THE SAME TIME AND IN THE SAME LOCALITY. DRAPER ADEN ASSOCIATES MAKES NO WARRANTIES, EXPRESS OR IMPLIED, UNDER THIS AGREEMENT IN CONNECTION WITH DRAPER ADEN ASSOCIATES' SERVICES.

CONCLUSIONS PRESENTED ARE BASED UPON A REVIEW OF AVAILABLE INFORMATION, THE RESULTS OF OUR FIELD STUDIES, AND/OR PROFESSIONAL JUDGMENT. TO THE BEST OF OUR KNOWLEDGE, INFORMATION PROVIDED BY OTHERS IS TRUE AND ACCURATE, UNLESS OTHERWISE NOTED.

DRAPER ADEN ASSOCIATES' LIABILITY, HEREUNDER, SHALL BE LIMITED TO AMOUNTS DUE DRAPER ADEN ASSOCIATES FOR SERVICES ACTUALLY RENDERED, OR REIMBURSABLE EXPENSES ACTUALLY INCURRED.

ANY REUSE OR MODIFICATION OF ANY OF THE AFOREMENTIONED DOCUMENTS (WHETHER HARD COPIES OR ELECTRONIC TRANSMITTALS) PREPARED BY DRAPER ADEN ASSOCIATES WITHOUT WRITTEN VERIFICATION OR ADAPTATION BY DRAPER ADEN ASSOCIATES WILL BE AT THE SOLE RISK OF THE INDIVIDUAL OR ENTITY UTILIZING SAID DOCUMENTS AND SUCH USE IS WITHOUT THE AUTHORIZATION OF DRAPER ADEN ASSOCIATES. DRAPER ADEN ASSOCIATES SHALL HAVE NO LEGAL LIABILITY RESULTING FROM ANY AND ALL CLAIMS, DAMAGES, LOSSES, AND EXPENSES, INCLUDING ATTORNEY'S FEES ARISING OUT OF THE UNAUTHORIZED REUSE OR MODIFICATION OF THESE DOCUMENTS. CLIENT SHALL INDEMNIFY DRAPER ADEN ASSOCIATES FROM ANY CLAIMS ARISING OUT OF UNAUTHORIZED USE OR MODIFICATION OF THE DOCUMENTS WHETHER HARD COPY OR ELECTRONIC.

CONCLUSIONS PRESENTED BY DRAPER ADEN ASSOCIATES DO NOT REFLECT VARIATIONS IN SUBSURFACE GROUNDWATER QUALITY THAT MIGHT EXIST BETWEEN OR BEYOND SAMPLING POINTS OR BETWEEN SPECIFIC SAMPLE COLLECTIONS EVENTS. DRAPER ADEN ASSOCIATES SHALL INCUR NO LIABILITY RESULTING FROM INFORMATION SUPPLIED BY OTHERS.

## EXECUTIVE SUMMARY

This document presents the Annual Groundwater Monitoring Report for calendar year 2011 for Hazardous Waste Management Units (HWMUs) 5, 7, 10, and 16 located at the Radford Army Ammunition Plant (Radford AAP) in Radford, Virginia. The Annual Groundwater Monitoring Report was compiled in accordance with the requirements specified in the Final Hazardous Waste Post-Closure Care Permit dated October 4, 2002, for HWMUs 5, 7, 10, and 16. This Annual Groundwater Monitoring Report evaluates the analytical data from Second Quarter 2011 and Fourth Quarter 2011 for each Unit.

### HWMU-5

The calendar year 2011 groundwater monitoring events served as the third and fourth semiannual Corrective Action (CA) groundwater monitoring events for HWMU-5 conducted in accordance with Permit Module VI – *Groundwater Corrective Action & Monitoring Program for Unit 5*, which was approved by the Virginia Department of Environmental Quality (VDEQ) in the *Final Class 3 Hazardous Waste Permit Modification* dated November 5, 2009.

During Second Quarter 2011, trichloroethene (TCE) was detected in point of compliance wells 5WC22 and 5WC23 at concentrations greater than the GPS of 5 µg/l. During Fourth Quarter 2011, TCE was detected in point of compliance wells 5WC22 and 5WC23 at concentrations less than the GPS of 5 µg/l; however, TCE was detected in point of compliance well 5WC21 at a concentration greater than the GPS of 5 µg/l during Fourth Quarter 2011. No daughter products of TCE were detected in any wells during the 2011 monitoring events. The observed concentration fluctuations of TCE in point of compliance wells 5WC21, 5WC22, and 5WC23 are consistent with typical historical concentration fluctuations of TCE in those wells. TCE was not detected at concentrations greater than the GPS in any other wells comprising the CA monitoring network during the calendar year 2011 monitoring events, and no daughter products of TCE were detected in the wells comprising the CA monitoring network. In accordance with the Permit, the effectiveness of the corrective action (monitored natural attenuation [MNA]) was assessed, found to be effective, and no additional action is required.

During Second Quarter 2011, total cobalt was detected in point of compliance wells 5WC21 and 5WC22 at concentrations greater than the revised GPS of 7 µg/l. As directed by the VDEQ during a meeting with Radford AAP on May 4, 2011, total cobalt was added to the list of CA Targeted Constituents for HWMU-5. During Fourth Quarter 2011, total cobalt was detected in point of compliance well 5WC21 at a concentration greater than the GPS of 7 µg/l; however, total cobalt was not detected at concentrations greater than the GPS in the other wells comprising the CA monitoring network.

Overall, evaluation of calendar year 2011 data for the CA Targeted Constituents and comparison with historical data indicates effective progress of groundwater CA through natural attenuation. No changes to the continuation of the groundwater CA program are anticipated at this time.

## **HWMU-7**

Based on an evaluation of the groundwater analytical data and additional information for HWMU-7, no constituents were detected in the point of compliance wells at concentrations greater than their respective GPSs during calendar year 2011. Therefore, no further action is recommended at this time.

Initial detections of additional Permit Attachment 1, Appendix I constituents during Second Quarter 2011 were refuted by subsequent verification sampling; therefore, no changes to the Groundwater Compliance Monitoring List for the Unit are required.

An evaluation of the plume monitoring well data indicates that the concentrations of total barium in plume monitoring wells 7W10B and 7W10C were greater than the site-specific background concentration. Additionally, the concentration of total zinc in plume monitoring well 7W10B during Fourth Quarter 2011 was greater than the site-specific background concentration. Higher total barium and total zinc concentrations in downgradient plume monitoring wells relative to background at HWMU-7 may be the result of natural variations in trace element distribution in groundwater. In addition, these concentrations are consistent with previous barium and zinc concentrations detected these wells. Therefore, no further action regarding the total barium concentrations detected in plume monitoring wells 7W10B and 7W10C or the total zinc concentration detected in plume monitoring well 7W10B is recommended at this time.

Total cobalt was detected in plume monitoring well 7W13 during both 2011 monitoring events at concentrations greater than the site-specific background concentration of 5 µg/l. Additionally, the total cobalt concentration detected in plume monitoring well 7W13 during Fourth Quarter 2011 was greater than the revised GPS of 5 µg/l specified in the VDEQ-approved Class 3 Permit Modification dated September 27, 2011. On December 15, 2011, Radford AAP submitted an ASD for total cobalt in groundwater at HWMU-7 as recommended by the VDEQ. The results of the ASD concluded that the total cobalt concentrations observed in groundwater at HWMU-7 are derived from ambient, naturally-occurring and naturally variable sources. The VDEQ approved the ASD in correspondence dated January 5, 2012, stating that the facility is not required to remediate cobalt in groundwater at HWMU-7. Therefore, no further action regarding total cobalt in plume monitoring well 7W13 is recommended at this time.

## **HWMU-10**

Based on an evaluation of the groundwater analytical data and additional information for HWMU-10, acetone and 2-propanol were detected in point of compliance well 10D3D at concentrations greater than their respective GPSs during Fourth Quarter 2011. In accordance with the Permit, Radford AAP will conduct an ASD to evaluate whether the acetone and 2-propanol concentrations detected in point of compliance well 10D3D are derived from a source other than the Unit.

No additional Permit Attachment 1, Appendix I constituents were detected during Second Quarter 2011; therefore, no changes to the Groundwater Compliance Monitoring List for the Unit are required.

## **HWMU-16**

Based on an evaluation of the groundwater analytical data and additional information for HWMU-16, no constituents were detected at concentrations greater than their respective GPS during calendar year 2011. Therefore, no further action is recommended at this time.

The additional Permit Attachment 1, Appendix I constituent benzene was verified at a concentration greater than the detection limit in point of compliance well 16MW9; therefore, benzene will be added to the Groundwater Compliance Monitoring List for the Unit. No other additional Permit Attachment 1, Appendix I constituents were confirmed in the point of compliance wells during Second Quarter 2011.

Evaluation of the plume monitoring well data indicated that the concentrations of total barium in upgradient well 16C1 and in plume monitoring wells 16-1, 16-2, 16-3, and 16SPRING were greater than the site-specific background concentration. Higher total barium concentrations in downgradient plume monitoring wells relative to background are likely due to natural variations in trace element distribution in groundwater. Upgradient well 16C1 is screened in limestone while downgradient plume monitoring wells 16-1, 16-2, 16-3, and 16-5 are screened in shale and fault breccia. Such differing lithologic formations would be expected to contain very different trace element distributions. Therefore, no further action regarding the 2011 total barium concentrations detected in plume monitoring wells 16-1, 16-2, and 16-3 and in spring sampling location 16SPRING is recommended at this time.

## **1.0 INTRODUCTION**

This document presents the Annual Groundwater Monitoring Report for calendar year 2011 for Hazardous Waste Management Units (HWMUs) 5, 7, 10, and 16 located at the Radford Army Ammunition Plant (Radford AAP) in Radford, Virginia. The Annual Groundwater Monitoring Report was compiled in accordance with the requirements specified in the Final Hazardous Waste Post-Closure Care Permit dated October 4, 2002, for HWMUs 5, 7, 10, and 16.

The Annual Groundwater Monitoring Report presents the following set of information for each Unit: basic information and unit identification, a description of the groundwater monitoring plan, a discussion of groundwater movement, potentiometric surface maps, a table of groundwater elevations, and detailed statistical evaluations of the analytical data.

Please note that the sampling frequency for HWMUs 5, 7, 10, and 16 was changed from quarterly to semiannual in the VDEQ-approved Class 1 Permit Modification dated June 14, 2007. Therefore, this Annual Groundwater Monitoring Report evaluates the analytical data from Second Quarter 2011 and Fourth Quarter 2011 for each Unit. Additionally, the Compliance Monitoring Constituent Lists and Groundwater Protection Standards (GPS) for HWMUs 7, 10, and 16 were revised in the VDEQ-approved Class 3 Permit Modification dated September 27, 2011. The groundwater samples collected at HWMUs 7, 10, and 16 during the Fourth Quarter 2011 semiannual monitoring event were analyzed and evaluated in accordance with the VDEQ-approved Class 3 Permit Modification. Copies of correspondence relating to groundwater monitoring activities conducted at HWMUs 5, 7, 10, and 16 during calendar year 2011 are included (on CD-ROM) in **Appendix G**.

### **1.1 HWMU-5**

HWMU-5 is a closed lined neutralization pond. The Unit received certification for closure in 1989. As stated in Permit Condition I.K.1 of the Final Post-Closure Care Permit, the Compliance Period during which the Groundwater Protection Standard applies to HWMU-5 is 19 years, beginning on the effective date of the original Post-Closure Care Permit for HWMU-5 (October 28, 2001) and continuing until October 28, 2020. The Second Quarter 2010 groundwater monitoring event served as the first semiannual Corrective Action (CA) groundwater monitoring event for HWMU-5 conducted in accordance with Permit Module VI – Groundwater Corrective Action & Monitoring Program for Unit 5, which was approved by the VDEQ in the Final Class 3 Hazardous Waste Permit Modification dated November 5, 2009. This report is the tenth complete Annual Groundwater Monitoring Report submitted to the Virginia Department of Environmental Quality (VDEQ) for this Unit during the Compliance Period, and the second complete Annual Groundwater Monitoring Report submitted to the VDEQ under the Groundwater Corrective Action & Monitoring Program.

### **1.2 HWMU-7**

HWMU-7 is a closed unlined holding and neutralization basin. The Unit received certification for closure in 1990. As stated in Permit Condition I.K.2, the Compliance Period during which the Groundwater Protection Standard applies to HWMU-7 is 18 years, beginning on the effective date of the original Post-Closure Care Permit for HWMU-7 (October 30, 1999)

and continuing until October 30, 2017. This report is the twelfth complete Annual Groundwater Monitoring Report submitted to the VDEQ for this Unit during the Compliance Period.

### **1.3 HWMU-10**

HWMU-10 is a closed equalization basin for the biological treatment system. The Unit received certification for closure in 1998. As stated in Permit Condition I.K.3, the Compliance Period during which the Groundwater Protection Standard applies to HWMU-10 is 18 years, beginning on the effective date of the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Management Units 5, 7, 10, and 16 (October 4, 2002) and continuing until October 4, 2020. This report is the tenth Annual Groundwater Monitoring Report submitted to the VDEQ for this Unit during the Compliance Period.

### **1.4 HWMU-16**

HWMU-16 is a closed hazardous waste landfill. The Unit received certification for closure in 1993. As stated in Permit Condition I.K.4, the Compliance Period during which the Groundwater Protection Standard applies to HWMU-16 is 13 years, beginning on the effective date of the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Management Units 5, 7, 10, and 16 (October 4, 2002) and continuing until October 4, 2015. This report is the tenth Annual Groundwater Monitoring Report submitted to the VDEQ for this Unit during the Compliance Period.

## 2.0 HWMU-5 ANNUAL GROUNDWATER MONITORING REPORT

### 2.1 Waste Management Unit Information

**Unit Name:** Hazardous Waste Management Unit 5 (HWMU-5)

**Owner/Operator:** United States Army/Alliant Techsystems Inc.

**Unit Location:** Radford AAP Main Plant Area, Radford, Virginia

**Class:** Hazardous Waste Management Unit

**Type:** Closed Lined Neutralization Pond

### 2.2 Groundwater Monitoring Plan

#### Monitoring Network:

Upgradient Well: 5W8B

Point of Compliance Wells: 5W5B, 5W7B, 5WC21, 5WC22, 5WC23

Plume Monitoring Wells: 5W12A

Observation Wells: S5W5, S5W7, 5W9A, 5W10A, 5W11A, 5WCA, S5W6, S5W8, 5WC11, 5WC22

**Monitoring Status:** Corrective Action Monitoring Program

#### CY 2011 Monitoring Events:

Second Quarter 2011: May 3-4, 2011

Fourth Quarter 2011: October 31-November 1, 2011

The calendar year 2011 groundwater monitoring events served as the first and second semiannual Corrective Action (CA) groundwater monitoring events for HWMU-5 conducted in accordance with Permit Module VI – *Groundwater Corrective Action & Monitoring Program for Unit 5*, which was approved by the Virginia Department of Environmental Quality (VDEQ) in the *Final Class 3 Hazardous Waste Permit Modification* dated November 5, 2009.

### 2.3 Groundwater Movement

The monitoring wells at HWMU-5 are screened entirely within either weathered carbonate bedrock residuum or alluvium or across the weathered residuum/carbonate bedrock interface. The static water level measurements gathered during the 2011 semiannual monitoring events are summarized in **Table 1**. Groundwater fluctuations ranged from 0.03 to 5.09 feet during the 2011 groundwater monitoring events. As shown on the HWMU-5 Potentiometric Surface Maps (**Appendix A-1**), groundwater movement beneath the site is generally to the northeast.

Darcian flow conditions were assumed for the alluvium, residuum, and carbonate bedrock beneath HWMU-5. As a result, the groundwater velocities were calculated by multiplying the hydraulic conductivity (determined from previously conducted slug tests) by the

average hydraulic gradient across the site and dividing by an assumed effective porosity for the aquifer. The average hydraulic gradient was determined by superimposing three evenly spaced flow line vectors over the potentiometric surface map, measuring their lengths, calculating the head differential over the distances measured, and dividing the head differential by the length of the flow line vectors. The three calculated gradients were then averaged to a single value. Using this method, the average groundwater hydraulic gradient across the site based on Fourth Quarter 2011 groundwater elevations was calculated to be 0.028 ft/ft. Historical slug test data for the site yielded an average hydraulic conductivity of  $5.25 \times 10^{-5}$  ft/second. This value is consistent with literature values for carbonate rock and for clayey, silty sand and gravel alluvium and residuum (Domenico and Schwartz, 1990).

The estimated groundwater velocity across the site was calculated to be approximately 0.32 ft/day or 116 ft/year based on the following:

- Average hydraulic conductivity of  $5.25 \times 10^{-5}$  ft/second.
- Average hydraulic gradient of 0.028 ft/ft.
- Assumed effective porosity of 0.40, based on a representative range of porosities for carbonate rock, weathered residuum, and clayey, silty sand and gravel alluvium (Domenico and Schwartz, 1990).

The actual groundwater flow velocities in the carbonate bedrock may vary as much as one to two orders of magnitude from the velocity presented above depending on water level conditions and the distribution of solution features.

## 2.4 Groundwater Analytical Data Evaluation

The calendar year 2011 groundwater monitoring events served as the third and fourth semiannual Corrective Action (CA) groundwater monitoring events for HWMU-5 conducted in accordance with Permit Module VI – *Groundwater Corrective Action & Monitoring Program for Unit 5*, which was approved by the VDEQ in the *Final Class 3 Hazardous Waste Permit Modification* dated November 5, 2009. Specifically, the Second Quarter 2011 and Fourth Quarter 2011 events served as the third and fourth semiannual monitoring events in which all of the wells in the CA groundwater monitoring network were sampled for the constituents listed in Appendix J to Permit Attachment 2 (Groundwater Corrective Action Targeted Constituents - GPS and Semiannual Monitoring List for HWMU-5). The Second Quarter 2011 event also served as the annual monitoring event in which the point of compliance wells at HWMU-5 were sampled for the constituents listed in Appendix K to Permit Attachment 2 (Groundwater Corrective Action Annual Monitoring List).

The laboratory analytical results for the 2011 monitoring events are summarized in **Appendix A-2** (Groundwater Corrective Action Targeted Constituents - GPS and Semiannual Monitoring List) and in **Appendix A-3** (Groundwater Corrective Action Annual Monitoring List). The laboratory analytical results for the 2011 monitoring events are included on CD-ROM in **Appendix E**. The analytical data were validated in accordance with SW-846, *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review*, and *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*.

Data validation reports are included in **Appendix E**. Copies of field notes recorded during sample collection are included on CD-ROM in **Appendix F**.

#### **2.4.1 Semiannual Monitoring for Corrective Action Targeted Constituents**

During the Second Quarter 2011 and Fourth Quarter 2011 monitoring events, groundwater samples collected from all of the wells in the CA groundwater monitoring network were analyzed for the CA Targeted Constituents listed in Appendix J to Permit Attachment 2. The CA Targeted Constituents consist of TCE and its daughter products: 1,1-dichloroethene (1,1-DCE), *cis*-1,2-dichloroethene (*c*DCE), *trans*-1,2-dichloroethene (*t*DCE), and vinyl chloride (VC). The laboratory analytical results for the CA Targeted Constituents are summarized in **Appendix A-2**.

During Second Quarter 2011, TCE was detected in point of compliance wells 5W5B and 5WC21 at concentrations of 0.9 µg/l and 4.9 µg/l, respectively, which are less than the GPS of 5 µg/l (**Appendix A-2**). However, TCE was detected in point of compliance wells 5WC22 and 5WC23 at concentrations of 5.2 µg/l and 5.3 µg/l, respectively, which are greater than the GPS of 5 µg/l (**Appendix A-2**). TCE was not detected in any of the other wells in the CA groundwater monitoring network. Additionally, the TCE daughter products were not detected in any of the wells comprising the CA groundwater monitoring network.

During Fourth Quarter 2011, TCE was detected in point of compliance well 5W5B at a concentration of 0.9 µg/l and in point of compliance wells 5WC22 and 5WC23 each at a concentration of 4.9 µg/l, which are less than the GPS of 5 µg/l (**Appendix A-2**). However, TCE was detected in point of compliance well 5WC21 at a concentration of 7.3 µg/l, which is greater than the GPS of 5 µg/l (**Appendix A-2**). TCE was not detected in any of the other wells in the CA groundwater monitoring network. Additionally, the TCE daughter products were not detected in any of the wells comprising the CA groundwater monitoring network.

As directed by the VDEQ during a meeting with Radford AAP on May 4, 2011, total cobalt was added to the list of CA Targeted Constituents for HWMU-5. During Fourth Quarter 2011, total cobalt was detected in point of compliance wells 5W7B, 5WC22, and 5WC23 at concentrations less than the QL of 5 µg/l and less than the GPS of 7 µg/l. Total cobalt was detected in point of compliance well 5WC21 at a concentration of 55.4 µg/l, which is greater than the GPS of 7 µg/l. Total cobalt was not detected at concentrations greater than the GPS in the other wells comprising the CA monitoring network.

#### **2.4.2 Annual Monitoring List - Comparison to Groundwater Protection Standards**

During Second Quarter 2011, groundwater samples collected from the point of compliance wells for HWMU-5 were analyzed for the constituents listed in Appendix K to Permit Attachment 2 (Groundwater Corrective Action Annual Monitoring List). Annual monitoring for the constituents listed in Appendix K is required in order to evaluate whether additional hazardous constituents that are not the targets for the current Corrective Action (e.g., TCE and its daughter products) are present at concentrations greater than the GPS for the Unit.

As part of the November 5, 2009 *Final Class 3 Hazardous Waste Permit Modification*, the GPS for HWMU-5 were revised to incorporate the January 2009 VDEQ Alternate Concentration Limits (ACLs). As a result, the GPS for total cobalt was reduced from the previous VDEQ ACL used in the original Permit (313 µg/l) to the HWMU-5 background concentration of 7 µg/l. During Second Quarter 2011, total cobalt was detected in point of compliance wells 5WC21 and 5WC22 at concentrations of 61.9 µg/l and 24.5 µg/l, respectively, which are greater than the revised GPS of 7 µg/l (**Appendix A-3**). During a meeting between VDEQ and Radford AAP on May 4, 2011, the VDEQ indicated that the ongoing Corrective Action monitoring program at HWMU-5 is sufficient to address the total cobalt concentrations which are greater than the new GPS, and that total cobalt should be added to the list of CA Targeted Constituents presented in Appendix J to Permit Attachment 2.

On June 29-30, 2011, Radford AAP re-developed wells 5WC21 and 5WC22 in an effort to reduce turbidity and collected groundwater samples for laboratory analysis in order to evaluate the influence of sediment on total cobalt concentrations in groundwater in the wells. Following re-development, the June 2011 groundwater sample collected from well 5WC21 exhibited a total cobalt concentration of 62.9 µg/l, which was comparable with the Second Quarter 2011 concentration of 61.9 µg/l. However, the June 2011 groundwater sample collected from well 5WC22 exhibited a total cobalt concentration of 2.11 µg/l following re-development, which was an order of magnitude less than the Second Quarter 2011 concentration of 24.5 µg/l. On July 27, 2011, Radford AAP collected additional groundwater samples from wells 5WC21 and 5WC22 to evaluate the effectiveness of re-development of the wells; groundwater samples collected from the wells in July 2011 were analyzed for total and dissolved cobalt. The July 2011 groundwater sample from well 5WC21 exhibited a total cobalt concentration of 76.9 µg/l and a dissolved cobalt concentration of 70.1 µg/l (again, comparable to the Second Quarter 2011 total cobalt concentration of 61.9 µg/l). The July 2011 groundwater sample from well 5WC22 exhibited a total cobalt concentration of 4.79 µg/l and a dissolved cobalt concentration of 4.60 µg/l, which were significantly less than the Second Quarter 2011 concentration of 24.5 µg/l. Based on these results, it appeared that the re-development efforts significantly reduced the total cobalt concentration in well 5WC22, but did not significantly affect the total cobalt concentration in well 5WC21. Therefore, as directed by the VDEQ during the May 4, 2011 meeting with Radford AAP, total cobalt was added to the list of CA Targeted Constituents for HWMU-5.

No other additional hazardous constituents that are not targets for the current Corrective Action for the Unit were detected at concentrations greater than their respective GPS during Second Quarter 2011.

### **2.4.3 Annual Monitoring List – Verification of Estimated Values**

A footnote presented in Appendix K to Permit Attachment 2 indicates that verification is required for constituents detected at concentrations less than the Quantitation Limit (QL) if their associated GPS are 1) based on background values equal to the QL, and 2) are greater than the applicable risk-based concentrations (i.e., ACL or RBC). In these instances, verification must be conducted using an alternate low-level analytical method in order to confirm or refute the observed initial detections. If a concentration greater than the low-level analytical method QL is observed, then the GPS for that constituent will be updated, if warranted.

During Second Quarter 2011, nitrobenzene (which has a GPS based on a background value equal to the QL) was initially detected in point of compliance wells 5WC22 and 5WC23 at concentrations less than the QL of 10 µg/l. As a result, sample aliquots for point of compliance wells 5WC22 and 5WC23 which had been collected during the original Second Quarter 2011 sampling event, prepared by the laboratory, and held pending the initial analytical results were analyzed by the laboratory using an alternate low-level analytical method to confirm or refute the observed initial detections. Nitrobenzene was not detected at concentrations greater than the low-level analytical method QL of 1 µg/l in the samples collected from point of compliance wells 5WC22 and 5WC23; therefore, no further action is warranted.

## **2.5 Annual Evaluation of Effectiveness of Corrective Action**

In accordance with Sections VI.B.6, VI.J.4.f and VI.J.4.g and other applicable sections of the *Final Class 3 Hazardous Waste Permit Modification* dated November 5, 2009, Radford AAP performed an annual evaluation of the effectiveness of the Corrective Action Program (CAP) (monitored natural attenuation [MNA] program) for calendar year 2011. MNA is the current remedial measure implemented at the Unit to address TCE in groundwater at concentrations greater than the GPS. In accordance with the applicable sections of the Permit, the evaluation includes the following:

- Construction of long-term concentration plots of constituents of concern (COCs) detected at concentrations greater than their respective GPS.
- Calculation of a Point Attenuation Rate for each detected COC and determination of an updated compliance (MNA remedial) timeframe prediction based on revised point attenuation rates determined from concentration versus time graphs using the principles and methods presented in Section 7.4 of Permit Attachment 2, Appendix I (CAP).
- Comparison of updated MNA remedial timeframe to the 2019 MNA remedial timeframe (MNA goal per CAP).
- Determination of the effectiveness of the Current Remedial Measure.

### **2.5.1 Construction of Long-term Concentration Plots of COCs**

In accordance with the Permit, graphs of natural-log concentration versus time for monitoring wells exhibiting current detections of TCE and degradation products (current COCs) at concentrations greater than their respective GPS values were constructed (**Appendix A-4**). During Second Quarter 2011, TCE was detected in point of compliance well 5WC21 at a concentration less than the GPS of 5 µg/l and in point of compliance wells 5WC22 and 5WC23 at concentrations greater than the GPS of 5 µg/l. However, during Fourth Quarter 2010, TCE was detected in wells 5WC22 and 5WC23 at concentrations less than the GPS of 5 µg/l and in well 5WC21 at a concentration greater than the GPS of 5 µg/l. TCE was not detected at concentrations greater than the GPS in any other wells comprising the CA monitoring network during the calendar year 2011 monitoring events. The observed concentration fluctuations of TCE in point of compliance wells 5WC21, 5WC22, and 5WC23 are consistent with typical historical concentration fluctuations of TCE in those wells. In accordance with the Permit, long-term concentration plots of the natural-log concentrations of TCE in wells 5WC21, 5WC22, and

5WC23 versus time were constructed. A linear regression line shows clearly decreasing trends in TCE concentration in wells 5WC21, 5WC22, and 5WC23 over time (**Appendix A-4**). An isoconcentration map illustrating TCE concentrations detected in groundwater during the Fourth Quarter 2011 event is included in **Appendix A-4**.

TCE was detected in monitoring well 5W5B during both 2011 monitoring events at concentrations less than the GPS of 5 µg/l. Therefore, a concentration plot was not required for TCE in that well. The TCE concentration in 5W5B continues to show a consistent decrease in comparison with historical data (**Appendix A-4**).

To date no daughter products of TCE (i.e., other COCs) have been detected in the groundwater samples collected at from the wells comprising the CA monitoring network at HWMU-5.

Overall, the above evaluation shows that concentrations of TCE are decreasing in the groundwater at the Unit. Therefore, the current remedial measure (MNA) is performing effectively in addressing the TCE concentrations in groundwater at the Unit.

### **2.5.2 Calculation of Point Attenuation Rates and Updated Compliance (MNA Remedial) Timeframe**

TCE is the only current COC detected at concentrations greater than its GPS at the Unit (specifically, in well 5WC21). Therefore an updated point attenuation rate was calculated for TCE concentration in well 5WC21. The updated point attenuation rate is 0.0006, which is based on a linear regression, where the slope of the regression represents the attenuation rate,  $k_{\text{point}}$  (see attached MNA Effectiveness Evaluation Concentration Trend Graph and Point Attenuation Rate Constant Calculation for TCE in Well 5WC21; **Appendix A-4**). The data set used to calculate the point attenuation rate encompasses TCE concentrations detected in well 5WC21 from the last 18 monitoring events beginning with April 18, 2005 to the present (November 1, 2011).

The updated MNA Compliance timeframe was calculated using the following equation:

$$t = -[\ln(C_{\text{goal}}/C_{\text{start}})]/k_{\text{point}}$$

whereas:

$t$  = predicted GPS remedial time frame

$C_{\text{goal}}$  = GPS concentration (5 µg/l)

$C_{\text{start}}$  = current constituent concentration (7.3 µg/l)

$k_{\text{point}}$  = natural attenuation rate (0.0006)

$$t = -[\ln(5/7.3)]/0.0006$$

$$t = 1.73 \text{ years}$$

The calculated current MNA timeframe (date) is mid-2013.

The current MNA timeframe is less than that 2019 MNA goal (MNA remedial timeframe presented in the CAP) and less than the 2026 MNA ineffective date (as specified in the CAP). Therefore, the current remedy is considered effective and no additional action is required.

## **2.6 Recommendations**

During Second Quarter 2011, TCE was detected in point of compliance well 5WC21 at a concentration less than the GPS of 5 µg/l and in point of compliance wells 5WC22 and 5WC23 at concentrations greater than the GPS of 5 µg/l. During Fourth Quarter 2010, TCE was detected in wells 5WC22 and 5WC23 at concentrations less than the GPS of 5 µg/l and in well 5WC21 at a concentration greater than the GPS of 5 µg/l. However, no daughter products of TCE were detected in any of the wells comprising the CA monitoring network during the 2011 monitoring events. The observed concentration fluctuations of TCE in point of compliance wells 5WC21, 5WC22, and 5WC23 are consistent with typical historical concentration fluctuations of TCE in those wells. TCE was not detected at concentrations greater than the GPS in any other wells comprising the CA monitoring network during the calendar year 2011 monitoring events, and no daughter products of TCE were detected in the wells comprising the CA monitoring network. In accordance with the Permit, long-term concentration plots of the natural-log concentrations of TCE in wells 5WC21, 5WC22, and 5WC23 versus time were constructed. A linear regression line shows clearly decreasing trends in TCE concentrations in wells 5WC21, 5WC22, and 5WC23 over time. Based on the data collected to date, the current calculated compliance timeframe for corrective action (monitored natural attenuation [MNA]) is mid-2013, which is less than the MNA remedial timeframe goal of 2019 as presented in the Permit, and less than the 2026 MNA ineffective date as specified in the Permit. Therefore, the current remedial measure (MNA) is performing effectively in addressing the TCE concentrations in groundwater at the Unit, and no additional action is required.

During Second Quarter 2011, total cobalt was detected in point of compliance wells 5WC21 and 5WC22 at concentrations greater than the revised GPS of 7 µg/l. As directed by the VDEQ during a meeting with Radford AAP on May 4, 2011, total cobalt was added to the list of CA Targeted Constituents for HWMU-5. During Fourth Quarter 2011, total cobalt was detected in point of compliance well 5WC21 at a concentration greater than the GPS of 7 µg/l; however, total cobalt was not detected at concentrations greater than the GPS in the other wells comprising the CA monitoring network. Overall, evaluation of calendar year 2011 data for the CA Targeted Constituents and comparison with historical data indicates effective progress of groundwater CA through natural attenuation. No changes to the continuation of the groundwater CA program are anticipated at this time.

### 3.0 HWMU-7 ANNUAL GROUNDWATER MONITORING REPORT

#### 3.1 Waste Management Unit Information

**Unit Name:** Hazardous Waste Management Unit 7 (HWMU-7)

**Owner/Operator:** United States Army/Alliant Techsystems Inc.

**Unit Location:** Radford AAP Main Plant Area, Radford, Virginia

**Class:** Hazardous Waste Management Unit

**Type:** Closed Unlined Holding and Neutralization Basin

#### 3.2 Groundwater Monitoring Plan

##### Monitoring Network:

Upgradient Well: 7W12B

Point of Compliance Wells: 7WCA, 7MW6, 7W11B

Plume Monitoring Wells: 7W9C, 7W10B, 7W10C, 7W13

Observation Wells: 7MW5, 7W9B, 7W11

**Monitoring Status:** Compliance Monitoring Program

##### CY 2011 Monitoring Events:

Second Quarter 2011: April 25-28, 2011

Fourth Quarter 2011: October 25-26, 2011

The Compliance Monitoring Constituent List and Groundwater Protection Standards (GPS) for HWMU-7 were revised in the VDEQ-approved Class 3 Permit Modification dated September 27, 2011. Therefore, the groundwater samples collected at HWMU-7 during the Fourth Quarter 2011 semiannual monitoring event were analyzed and evaluated in accordance with the VDEQ-approved Class 3 Permit Modification. Copies of the revised Compliance Monitoring Constituent List and Groundwater Protection Standards (GPS) for HWMU-7 as presented in the September 27, 2011 Class 3 Permit Modification are included (on CD-ROM) in **Appendix G**.

#### 3.3 Groundwater Movement

The monitoring wells at HWMU-7 are screened entirely within alluvium, weathered carbonate bedrock residuum, or carbonate bedrock or across the interfaces between two of the listed strata. The static water level measurements gathered during the 2011 semiannual monitoring events are summarized in **Table 2**. Groundwater fluctuations ranged from 0.45 to 2.97 feet annually. As shown on the HWMU-7 Potentiometric Surface Maps (**Appendix B-1**), groundwater movement beneath the site is generally to the west towards the New River and to the northeast and southwest toward the unnamed intermittent drainages that flow into the New River north and south of the site.

Darcian flow conditions were assumed for the alluvium, residuum, and carbonate bedrock beneath HWMU-7. As a result, the groundwater velocities were calculated by multiplying the hydraulic conductivity (determined from previously conducted slug tests) by the average hydraulic gradient across the site, and dividing by an assumed effective porosity for the aquifer materials. The average hydraulic gradient was determined by superimposing three evenly spaced flow line vectors over the potentiometric surface map, measuring their lengths, calculating the head differential over the distances measured, and dividing the head differential by the length of the flow line vectors. The three calculated gradients were then averaged to a single value. Using this method, the average groundwater hydraulic gradient across the site based on the Fourth Quarter 2011 groundwater elevations was calculated to be 0.008 ft/ft. Historical slug test data for the site yielded an average hydraulic conductivity of  $5.1 \times 10^{-6}$  ft/second. This value is consistent with literature values for carbonate rock and for clayey, silty sand and gravel alluvium and residuum (Domenico and Schwartz, 1990).

The estimated groundwater velocity across the site was calculated to be approximately  $8.81 \times 10^{-3}$  ft/day or 3.2 ft/year, based on the following:

- Average hydraulic conductivity of  $5.1 \times 10^{-6}$  ft/second.
- Average hydraulic gradient of 0.008 ft/ft.
- Assumed effective porosity of 0.40, based on a representative range of porosities for carbonate rock, weathered residuum, and clayey, silty sand and gravel alluvium (Domenico and Schwartz, 1990).

The actual groundwater flow velocities in the carbonate bedrock may vary as much as one to two orders of magnitude from the velocity presented above depending on water level conditions and the distribution of solution features.

### 3.4 Groundwater Analytical Data Evaluation

The groundwater samples collected from the compliance monitoring network during the 2011 semiannual monitoring events were analyzed for the constituents listed in Appendix E to Attachment 3 of the Final Post-Closure Care Permit, plus copper (which was added to the constituent list for HWMU-7 following Third Quarter 2003) and zinc (which was added to the constituent list for HWMU-7 following Second Quarter 2004) (please note, copper and zinc were formally added to Permit Attachment 3, Appendix E in the VDEQ-approved Class 3 Permit Modification dated September 27, 2011; **Appendix G**). In addition, during Second Quarter 2011 groundwater samples were collected from the upgradient well and the point of compliance wells for the annual monitoring for the constituents listed in Permit Attachment 1, Appendix I. The laboratory analytical results for the 2011 monitoring events are included in **Appendix B-2** (point of compliance wells) and in **Appendix B-3** (plume monitoring wells). The laboratory analytical results for the 2011 monitoring events also are included in electronic format in **Appendix E**. The analytical data were validated in accordance with SW-846, *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review*, and *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*. Data validation reports are included in **Appendix E**. Copies of field notes recorded during sample collection are included on CD-ROM in **Appendix F**.

### 3.4.1 Comparison to Groundwater Protection Standards

As specified in Permit Condition V.J.2.i, the 2011 groundwater analytical data for the upgradient well and the point of compliance wells were compared to the GPS for HWMU-7 listed in Appendix G of Permit Attachment 3 (please note, the GPS for HWMU-7 listed in Permit Attachment 3, Appendix G were revised in the VDEQ-approved Class 3 Permit Modification dated September 27, 2011; **Appendix G**). In accordance with Permit Condition V.I.2, Radford AAP performed a simple empirical comparison of the upgradient well and the point of compliance well data to the GPS (**Appendix B-2**).

As shown in **Appendix B-2**, no constituents were detected at concentrations greater than their respective GPS in the upgradient well and in the point of compliance wells during the 2011 monitoring events.

### 3.4.2 Comparison to Background Concentrations

As specified in Permit Condition V.O, the 2011 groundwater analytical data for the plume monitoring wells were compared to the background concentrations for HWMU-7. The original background concentrations as presented in the Groundwater Quality Assessment Report for HWMU-7 dated August 1998 are listed in Appendix F of Permit Attachment 3. In accordance with Permit Condition V.I.2, Radford AAP performed a simple empirical comparison of the plume monitoring well data to the background concentrations (**Appendix B-3**).

As shown in **Appendix B-3**, total barium concentrations detected in plume monitoring wells 7W10B and 7W10C during both 2011 semiannual monitoring events were greater than the site-specific background concentration of 41 µg/l. However, the total barium concentrations detected in wells 7W10B and 7W10C were more than an order of magnitude below the USEPA MCL for barium of 2,000 µg/l. Higher total barium concentrations in downgradient plume monitoring wells relative to background at HWMU-7 may be the result of natural variations in trace element distribution in groundwater. In addition, these concentrations are consistent with previous barium concentrations detected these wells.

As shown in **Appendix B-3**, total zinc was detected in plume monitoring well 7W10B during Fourth Quarter 2011 at a concentration greater than the site-specific background concentration of 10.9 µg/l. However, the total zinc concentration detected in well 7W10B is more than an order of magnitude less than the VDEQ ACL for zinc of 4,695 µg/l. In addition, total zinc was not detected at a concentration greater than the site-specific background concentration of 10.9 µg/l in plume monitoring well 7W10C, which is located approximately 60 feet downgradient from well 7W10B.

As also shown in **Appendix B-3**, total cobalt was detected in plume monitoring well 7W13 during both 2011 monitoring events at concentrations greater than the site-specific background concentration of 5 µg/l. Additionally, the total cobalt concentration detected in plume monitoring well 7W13 during Fourth Quarter 2011 was greater than the revised GPS of 5 µg/l specified in the VDEQ-approved Class 3 Permit Modification dated September 27, 2011. However, the total cobalt concentrations detected in plume monitoring well 7W13 are consistent

with previous concentrations detected in this well. During teleconferences on November 9, 2011 and November 17, 2011, the VDEQ recommended Radford AAP submit an alternate source demonstration (ASD) for total cobalt concentrations detected in groundwater at HWMU-7. Radford AAP submitted the ASD to the VDEQ on December 15, 2011. The results of the ASD concluded that the total cobalt concentrations observed in groundwater at HWMU-7 are derived from ambient, naturally-occurring and naturally variable sources. The VDEQ approved the ASD in correspondence dated January 5, 2012, stating that the facility is not required to remediate cobalt in groundwater at HWMU-7.

No other constituent concentrations detected in the plume monitoring wells were greater than their respective background concentrations.

In accordance with the requirements of Permit Condition V.K.3, the established background values and the computations used to determine the background values are included in **Appendix B-4**. The background values and associated computations are taken from the revised background values presented in the pending Closure Report for HWMU-7.

### **3.4.3 Annual Monitoring for Constituents Listed in Permit Attachment 1, Appendix I**

Upon receipt of the Second Quarter 2011 analytical data, Radford AAP notified the VDEQ of the detection of three additional Permit Attachment 1, Appendix I constituents (benzene, chloroform, and diethyl ether) that were not listed in Appendix E of Permit Attachment 3 (Unit 7 – Groundwater Compliance Monitoring (Quarterly) Constituent List). As shown on **Appendix B-2**, chloroform was detected in upgradient well 7W12B and in point of compliance wells 7WCA and 7W11B. However, Radford AAP did not verify the chloroform concentrations detected in wells 7W12B, 7WCA, and 7W11B based on the June 14, 2007 concurrence by the VDEQ with the Alternate Source Demonstration (ASD) for chloroform at HWMU-7 submitted on January 31, 2007, which identified an upgradient off-site source for chloroform in groundwater. Therefore, chloroform will not be added to the Groundwater Monitoring List for the Unit.

Benzene was initially detected in upgradient well 7W12B. Additionally, benzene was initially detected in point of compliance wells 7MW6 and 7W11B, and diethyl ether was initially detected in point of compliance well 7MW6. In accordance with the Permit, Radford AAP resampled well 7W11B for benzene and well 7MW6 for benzene and diethyl ether in order to confirm or refute the additional Permit Attachment 1, Appendix I constituent detections in the point of compliance wells. Benzene and diethyl ether were not confirmed in point of compliance wells 7MW6 and 7W11B at concentrations greater than their respective detection limits; as a result, benzene and diethyl ether will not be added to the Groundwater Monitoring List for the Unit. Furthermore, sampling of upgradient well 7W12B for Permit Attachment 1, Appendix I constituents is not required per the Post-Closure Care Permit for the Unit; therefore, benzene will not be added to the Groundwater Monitoring List for the Unit.

### **3.4.4 Evaluation of Total Arsenic Concentrations in Groundwater**

During Fourth Quarter 2010, total arsenic was initially detected in plume monitoring well 7W13 at a concentration greater than the site-specific background concentration of 10 µg/l.

Historical data indicated that total arsenic had not been detected in well 7W13 at concentrations equal to or greater than 10 µg/l during the previous 23 monitoring events. The results of subsequent verification sampling conducted in December 2010 to confirm or refute the initial concentration were inconclusive due to laboratory inconsistencies. Radford AAP notified VDEQ regarding the inconclusive verification results in January 2011. In subsequent electronic correspondence and further clarified in a meeting between Radford AAP and VDEQ on May 4, 2011, VDEQ recommended the collection of additional independent samples from well 7W13 for analysis for total arsenic during and following the first semiannual monitoring event for calendar year 2011.

Total arsenic was not detected in well 7W13 at a concentration equal to or greater than the quantitation limit (QL) and site-specific background concentration of 10 µg/l during the Second Quarter 2011 monitoring event. Independent groundwater samples collected from well 7W13 on June 30, 2011, and on July 27, 2011, also did not exhibit total arsenic concentrations equal to or greater than 10 µg/l. Furthermore, total arsenic has not been detected historically at a concentration equal to or greater than 10 µg/l in well 7W13 prior to Fourth Quarter 2011. Therefore, Radford AAP concluded that total arsenic had not been reliably detected at a concentration greater than background in well 7W13. Radford AAP submitted these results to the VDEQ in correspondence dated August 15, 2011. In correspondence dated August 29, 2011, the VDEQ concurred with Radford AAP's conclusions and agreed that no further action with respect to total arsenic in well 7W13 is necessary at this time. Copies of the August 15, 2011 and August 29, 2011 correspondence are included in **Appendix G**.

### **3.5 Recommendations**

Based on an evaluation of the groundwater analytical data and additional information for HWMU-7, no constituents were detected in the point of compliance wells at concentrations greater than their respective GPSs during calendar year 2011. Therefore, no further action is recommended at this time.

Initial detections of additional Permit Attachment 1, Appendix I constituents during Second Quarter 2011 were refuted by subsequent verification sampling; therefore, no changes to the Groundwater Compliance Monitoring List for the Unit are required.

An evaluation of the plume monitoring well data indicates that the concentrations of total barium in plume monitoring wells 7W10B and 7W10C were greater than the site-specific background concentration. Additionally, the concentration of total zinc in plume monitoring well 7W10B during Fourth Quarter 2011 was greater than the site-specific background concentration. As stated previously, higher total barium and total zinc concentrations in downgradient plume monitoring wells relative to background at HWMU-7 may be the result of natural variations in trace element distribution in groundwater. In addition, these concentrations are consistent with previous barium and zinc concentrations detected these wells. Therefore, no further action regarding the total barium concentrations detected in plume monitoring wells 7W10B and 7W10C or the total zinc concentration detected in plume monitoring well 7W10B is recommended at this time.

Total cobalt was detected in plume monitoring well 7W13 during both 2011 monitoring events at concentrations greater than the site-specific background concentration of 5 µg/l. Additionally, the total cobalt concentration detected in plume monitoring well 7W13 during Fourth Quarter 2011 was greater than the revised GPS of 5 µg/l specified in the VDEQ-approved Class 3 Permit Modification dated September 27, 2011. On December 15, 2011, Radford AAP submitted an ASD for total cobalt in groundwater at HWMU-7 as recommended by the VDEQ. The results of the ASD concluded that the total cobalt concentrations observed in groundwater at HWMU-7 are derived from ambient, naturally-occurring and naturally variable sources. The VDEQ approved the ASD in correspondence dated January 5, 2012, stating that the facility is not required to remediate cobalt in groundwater at HWMU-7. Therefore, no further action regarding total cobalt in plume monitoring well 7W13 is recommended at this time.

## **4.0 HWMU-10 ANNUAL GROUNDWATER MONITORING REPORT**

### **4.1 Waste Management Unit Information**

**Unit Name:** Hazardous Waste Management Unit 10 (HWMU-10)  
**Owner/Operator:** United States Army/Alliant Techsystems Inc.

**Unit Location:** Radford AAP Main Plant Area, Radford, Virginia

**Class:** Hazardous Waste Management Unit  
**Type:** Closed Equalization Basin for the Biological Treatment System

### **4.2 Groundwater Monitoring Plan**

#### **Monitoring Network:**

Upgradient Well: 10D4  
Point of Compliance Wells: 10MW1, 10DDH2R, 10D3, 10D3D  
Plume Monitoring Wells: none  
Observation Wells: none

**Monitoring Status:** Compliance Monitoring Program

#### **CY 2011 Monitoring Events:**

Second Quarter 2011: May 2-3, 2011  
Fourth Quarter 2011: October 24, 2011

The Compliance Monitoring Constituent List and Groundwater Protection Standards (GPS) for HWMU-10 were revised in the VDEQ-approved Class 3 Permit Modification dated September 27, 2011. Therefore, the groundwater samples collected at HWMU-10 during the Fourth Quarter 2011 semiannual monitoring event were analyzed and evaluated in accordance with the VDEQ-approved Class 3 Permit Modification. Copies of the revised Compliance Monitoring Constituent List and Groundwater Protection Standards (GPS) for HWMU-10 as presented in the September 27, 2011 Class 3 Permit Modification are included (on CD-ROM) in **Appendix G**.

### **4.3 Groundwater Movement**

The monitoring wells at HWMU-10 are screened either across the alluvium/limestone bedrock interface or entirely within bedrock. The static water level measurements gathered during the 2011 semiannual monitoring events are summarized in **Table 3**. Groundwater fluctuations ranged from 0.56 to 2.06 feet annually. As shown on the HWMU-10 Potentiometric Surface Maps (**Appendix C-1**), groundwater movement beneath the site is generally to the north towards the New River.

Darcian flow conditions were assumed for the alluvium and limestone bedrock beneath HWMU-10. As a result, the groundwater velocities were calculated by multiplying the hydraulic

conductivity (determined from previously conducted slug tests) by the average hydraulic gradient across the site and dividing by an assumed effective porosity for the aquifer materials. The average hydraulic gradient was determined by superimposing three evenly spaced flow line vectors over the potentiometric surface map, measuring their lengths, calculating the head differential over the distances measured, and dividing the head differential by the length of the flow line vectors. The three calculated gradients were then averaged to a single value. Using this method, the average groundwater hydraulic gradient across the site based on Fourth Quarter 2011 groundwater elevations was calculated to be 0.014 ft/ft. Historical slug test data for the site yielded an average hydraulic conductivity of  $4.9 \times 10^{-4}$  ft/second. This value is consistent with literature values for limestone and for clayey, silty sand and gravel alluvium (Domenico and Schwartz, 1990).

The estimated groundwater velocity across the site was calculated to be approximately 1.5 ft/day or 548 ft/year, based on the following:

- Average hydraulic conductivity of  $4.9 \times 10^{-4}$  ft/second.
- Average hydraulic gradient of 0.014 ft/ft.
- Assumed effective porosity of 0.40, based on a representative range of porosities for limestone and for clayey, silty sand and gravel alluvium (Domenico and Schwartz, 1990).

The actual groundwater flow velocities in the carbonate bedrock may vary as much as one to two orders of magnitude from the velocity presented above depending on water level conditions and the distribution of solution features.

#### **4.4 Groundwater Analytical Data Evaluation**

The groundwater samples collected from the compliance monitoring network during the 2011 semiannual monitoring events were analyzed for the constituents listed in Appendix E to Attachment 4 of the Final Post-Closure Care Permit, plus cobalt and vanadium (which were added to the constituent list for HWMU-10 following Second Quarter 2004) and acetone and 2-propanol (which were added to the constituent list for HMWU-10 following Second Quarter 2005) (please note, cobalt, vanadium, acetone, and 2-propanol were formally added to Permit Attachment 4, Appendix E in the VDEQ-approved Class 3 Permit Modification dated September 27, 2011; **Appendix G**). In addition, groundwater samples were collected from the upgradient well and the point of compliance wells for the annual monitoring for the constituents listed in Permit Attachment 1, Appendix I. The laboratory analytical results for the 2011 monitoring events are included in **Appendix C-2**. The laboratory analytical results for the 2011 monitoring events also are included in electronic format in **Appendix E**. The analytical data were validated in accordance with SW-846, *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review*, and *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*. Data validation reports are included in **Appendix E**. Copies of field notes recorded during sample collection are included on CD-ROM in **Appendix F**.

#### **4.4.1 Comparison to Groundwater Protection Standards**

As specified in Permit Condition V.J.3.i, the 2011 groundwater analytical data for the upgradient well and the point of compliance wells were compared to GPS for HWMU-10 listed in Appendix G of Permit Attachment 4 (please note, the GPS for HWMU-10 listed in Permit Attachment 4, Appendix G were revised in the VDEQ-approved Class 3 Permit Modification dated September 27, 2011; **Appendix G**). In accordance with Permit Condition V.I.2, Radford AAP performed a simple empirical comparison of the upgradient well and the point of compliance well data to the GPS (**Appendix C-2**).

As shown in **Appendix C-2**, none of the constituent concentrations detected in the upgradient well and in the point of compliance wells during Second Quarter 2011 were greater than their respective GPS.

During Fourth Quarter 2011, acetone was detected in point of compliance well 10D3D at a concentration of 20,000 µg/l, which is greater than the revised GPS of 8,750.2 µg/l. Additionally, 2-propanol was detected in point of compliance well 10D3D at a concentration of 34,000 µg/l, which is greater than the revised GPS of 100 µg/l. In accordance with the Permit, Radford AAP will conduct an ASD to evaluate whether the acetone and 2-propanol concentrations detected in point of compliance well 10D3D are derived from a source other than the Unit.

#### **4.4.2 Comparison to Background Concentrations**

Only the analytical data from plume monitoring wells are compared to background concentrations. However, the compliance monitoring network at HWMU-10 is composed entirely of point of compliance wells. Therefore, the analytical data from HWMU-10 is not compared to background concentrations.

#### **4.4.3 Annual Monitoring for Constituents Listed in Permit Attachment 1, Appendix I**

During Second Quarter 2011, the groundwater samples collected from the upgradient well and the point of compliance wells were analyzed for the constituents listed in Permit Attachment 1, Appendix I in accordance with Permit Condition V.J.3.e. No additional Permit Attachment 1, Appendix I, which are not listed in Appendix E of Permit Attachment 4 (Unit 10 – Groundwater Compliance Monitoring (Quarterly) Constituent List), were detected during the Second Quarter 2011 groundwater monitoring event. Therefore, no changes to the Groundwater Monitoring List for the Unit are required.

#### **4.5 Recommendations**

Based on an evaluation of the groundwater analytical data and additional information for HWMU-10, acetone and 2-propanol were detected in point of compliance well 10D3D at concentrations greater than their respective GPSs during Fourth Quarter 2011. In accordance with the Permit, Radford AAP will conduct an ASD to evaluate whether the acetone and 2-propanol concentrations detected in point of compliance well 10D3D are derived from a source other than the Unit.

No additional Permit Attachment 1, Appendix I constituents were detected during Second Quarter 2011; therefore, no changes to the Groundwater Compliance Monitoring List for the Unit are required.

## 5.0 HWMU-16 ANNUAL GROUNDWATER MONITORING REPORT

### 5.1 Waste Management Unit Information

**Unit Name:** Hazardous Waste Management Unit 16 (HWMU-16)

**Owner/Operator:** United States Army/Alliant Techsystems Inc.

**Unit Location:** Radford AAP Main Plant Area, Radford, Virginia

**Class:** Hazardous Waste Management Unit

**Type:** Closed Hazardous Waste Landfill

### 5.2 Groundwater Monitoring Plan

#### Monitoring Network:

Upgradient Well: 16C1

Point of Compliance Wells: 16WC1A, 16WC1B, 16MW8, 16MW9

Plume Monitoring Wells: 16-1, 16-2, 16-3, 16-5, 16WC2B, 16SPRING

Observation Wells: 16WC2A, 16C3, 16CDH3

**Monitoring Status:** Compliance Monitoring Program

#### CY 2011 Monitoring Events:

Second Quarter 2011: April 18-20, 2011

Fourth Quarter 2011: October 19-20, 2011

The Compliance Monitoring Constituent List and Groundwater Protection Standards (GPS) for HWMU-16 were revised in the VDEQ-approved Class 3 Permit Modification dated September 27, 2011. Therefore, the groundwater samples collected at HWMU-16 during the Fourth Quarter 2011 semiannual monitoring event were analyzed and evaluated in accordance with the VDEQ-approved Class 3 Permit Modification. Copies of the revised Compliance Monitoring Constituent List and Groundwater Protection Standards (GPS) for HWMU-16 as presented in the September 27, 2011 Class 3 Permit Modification are included (on CD-ROM) in **Appendix G**.

### 5.3 Groundwater Movement

The monitoring wells at HWMU-16 are screened entirely within either carbonate bedrock or weathered carbonate bedrock residuum, or across the residuum/bedrock interface. The static water level measurements gathered during the 2011 semiannual monitoring events are summarized in **Table 4**. Groundwater fluctuations ranged from 0.01 to 9.05 feet annually. As shown on the HWMU-16 Potentiometric Surface Maps (**Appendix D-1**), groundwater movement beneath the site is generally to the northeast.

Darcian flow conditions were assumed for the weathered residuum and carbonate bedrock beneath HWMU-16. As a result, the groundwater velocities were calculated by

multiplying the hydraulic conductivity (determined from previously conducted slug tests) by the average hydraulic gradient across the site and dividing by an assumed effective porosity for the aquifer materials. The average hydraulic gradient was determined by superimposing three evenly spaced flow line vectors over the potentiometric surface map, measuring their lengths, calculating the head differential over the distances measured, and dividing the head differential by the length of the flow line vectors. The three calculated gradients were then averaged to a single value. Using this method, the average groundwater hydraulic gradient across the site based on Fourth Quarter 2011 groundwater elevations was calculated to be 0.091 ft/ft. Historical slug test data for the site yielded an average hydraulic conductivity of  $7.87 \times 10^{-5}$  ft/second. This value is consistent with literature values for carbonate rock and for clay and silt residuum (Domenico and Schwartz, 1990).

The estimated groundwater velocity across the site was calculated to be approximately 1.55 ft/day or 566 ft/year based on the following:

- Average hydraulic conductivity of  $7.87 \times 10^{-5}$  ft/second.
- Average hydraulic gradient of 0.091 ft/ft.
- Assumed effective porosity of 0.40, based on a representative range of porosities for carbonate rock and clay and silt residuum (Domenico and Schwartz, 1990).

The actual groundwater flow velocities in the carbonate bedrock may vary as much as one to two orders of magnitude from the velocity presented above depending on water level conditions and the distribution of solution features.

## 5.4 Groundwater Analytical Data Evaluation

The groundwater samples collected from the compliance monitoring network during the 2010 semiannual monitoring events were analyzed for the constituents listed in Appendix E to Attachment 5 of the Final Post-Closure Care Permit, plus chloroethane, diethyl ether, dimethyl ether, and methylene chloride (which were added to the constituent list for HWMU-16 following Third Quarter 2003), and 1,1,2-trichloro-1,2,2-trifluoroethane (which was added to the constituent list for HWMU-16 following Second Quarter 2004) (please note, chloroethane, diethyl ether, dimethyl ether, methylene chloride, and 1,1,2-trichloro-1,2,2-trifluoroethane were formally added to Permit Attachment 5, Appendix E in the VDEQ-approved Class 3 Permit Modification dated September 27, 2011; **Appendix G**). In addition, groundwater samples were collected from the upgradient well and the point of compliance wells for the annual monitoring for the constituents listed in Permit Attachment 1, Appendix I. The laboratory analytical results for the 2011 monitoring events are included in **Appendix D-2** (point of compliance wells) and in **Appendix D-3** (plume monitoring wells). The laboratory analytical results for the 2011 monitoring events also are included in electronic format in **Appendix E**. The analytical data were validated in accordance with SW-846, *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review*, and *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*. Data validation reports are included in **Appendix E**. Copies of field notes recorded during sample collection are included on CD-ROM in **Appendix F**.

#### **5.4.1 Comparison to Groundwater Protection Standards**

As specified in Permit Condition V.J.4.i, the 2011 groundwater analytical data for the upgradient well and the point of compliance wells were compared to GPS for HWMU-16 listed in Appendix G of Permit Attachment 5 (please note, the GPS for HWMU-16 listed in Permit Attachment 5, Appendix G were revised in the VDEQ-approved Class 3 Permit Modification dated September 27, 2011; **Appendix G**). In accordance with Permit Condition V.I.2, Radford AAP performed a simple empirical comparison of the upgradient well and the point of compliance well data to the GPS (**Appendix D-2**).

As shown in **Appendix D-2**, no constituents were detected at concentrations greater than their respective GPS.

#### **5.4.2 Comparison to Background Concentrations**

As specified in Permit Condition V.O, the 2011 groundwater analytical data for the plume monitoring wells were compared to the background concentrations for HWMU-16 listed in Appendix F of Permit Attachment 5. In accordance with Permit Condition V.I.2, Radford AAP performed a simple empirical comparison of the plume monitoring well data to the background concentrations (**Appendix D-3**).

As shown in **Appendix D-3**, total barium concentrations detected in upgradient well 16C1 and plume monitoring well 16-1 during Second Quarter 2011 and in plume monitoring wells 16-2 and 16-3 and in spring sampling location 16SPRING during both 2011 semiannual monitoring events were greater than the background concentration of 175.4 µg/l. However, all of the total barium concentrations detected in the plume monitoring wells were well below the USEPA MCL for barium of 2,000 µg/l. Furthermore, higher barium concentrations in downgradient plume monitoring wells relative to background may be the result of natural variations in trace element distribution in groundwater. As illustrated in the boring logs for the compliance network monitoring wells (Appendix H of Permit Attachment 5), upgradient well 16C1 is screened in limestone while downgradient plume monitoring wells 16-1, 16-2, 16-3, and 16-5 are screened in shale and fault breccia. Such differing lithologic formations would be expected to contain very different trace element distributions.

No other constituent concentrations detected in the plume monitoring wells were greater than their respective background concentrations. In accordance with the requirements of Permit Condition V.K.3, the established background values and the computations used to determine the background values are included in **Appendix D-4**. The background values and associated computations are taken from the Groundwater Quality Assessment Report for HWMU-16 dated August 1999.

#### **5.4.3 Annual Monitoring for Constituents Listed in Permit Attachment 1, Appendix I**

During Second Quarter 2011, the groundwater samples collected from the upgradient well and the point of compliance wells were analyzed for the constituents listed in Permit Attachment 1, Appendix I in accordance with Permit Condition V.J.4.e. Upon receipt of the

Second Quarter 2011 analytical data, Radford AAP notified the VDEQ of the detection of six additional Permit Attachment 1, Appendix I constituents (4,4'-DDD, benzene, 1,1-dichloroethene, aldrin, gamma-BHC, and tetrahydrofuran) that were not listed in Appendix E of Permit Attachment 5 (Unit 16 – Groundwater Compliance Monitoring (Quarterly) Constituent List). Benzene, 1,1-dichloroethene, aldrin, gamma-BHC, and tetrahydrofuran were detected in upgradient well 16C1. Additionally, benzene was initially detected in point of compliance wells 16WC1A and 16MW9, and 4,4'-DDD was initially detected in point of compliance well 16WC1B. In accordance with the Permit, Radford AAP resampled wells 16WC1A and 16MW9 for benzene and well 16WC1B for 4,4'-DDD in order to confirm or refute the additional Permit Attachment 1, Appendix I constituent detections in the point of compliance wells.

Benzene was verified at a concentration greater than the detection limit in point of compliance well 16MW9; therefore, benzene will be added to the Groundwater Compliance Monitoring List for the Unit. 4,4'-DDD was not confirmed in point of compliance well 16WC1B at a concentration greater than the detection limit; as a result, 4,4'-DDD will not be added to the Groundwater Monitoring List for the Unit. Furthermore, sampling of upgradient well 16C1 for Permit Attachment 1, Appendix I constituents is not required per the Post-Closure Care Permit for the Unit; therefore, 1,1-dichloroethene, aldrin, gamma-BHC, and tetrahydrofuran will not be added to the Groundwater Monitoring List for the Unit.

## **5.5 Recommendations**

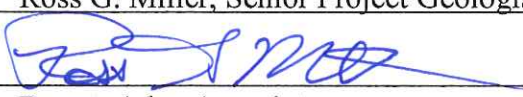

Based on an evaluation of the groundwater analytical data and additional information for HWMU-16, no constituents were detected at concentrations greater than their respective GPS during calendar year 2011. Therefore, no further action is recommended at this time.

The additional Permit Attachment 1, Appendix I constituent benzene was verified at a concentration greater than the detection limit in point of compliance well 16MW9; therefore, benzene will be added to the Groundwater Compliance Monitoring List for the Unit. No other additional Permit Attachment 1, Appendix I constituents were confirmed in the point of compliance wells during Second Quarter 2011.

Evaluation of the plume monitoring well data indicated that the concentrations of total barium in upgradient well 16C1 and in plume monitoring wells 16-1, 16-2, 16-3, and 16SPRING were greater than the site-specific background concentration. As stated previously, higher total barium concentrations in downgradient plume monitoring wells relative to background are likely due to natural variations in trace element distribution in groundwater. Upgradient well 16C1 is screened in limestone while downgradient plume monitoring wells 16-1, 16-2, 16-3, and 16-5 are screened in shale and fault breccia. Such differing lithologic formations would be expected to contain very different trace element distributions. Therefore, no further action regarding the 2011 total barium concentrations detected in plume monitoring wells 16-1, 16-2, and 16-3 and in spring sampling location 16SPRING is recommended at this time.

**Definitions:**

**Results are reported to the Permit Detection Limit.**

**First Corrective Action Monitoring Event Second Quarter 2010:**

**QL:** Denotes laboratory quantitation limit.

**Permit QL:** Denotes permit quantitation limit.

**DL:** Denotes laboratory detection limit.

**Permit DL:** Denotes permit detection limit.

**U:** Denotes not detected at or above the permit detection limit or QL.

**UA:** Denotes not detected at or above the adjusted detection limit or adjusted QL.

**J:** Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above the detection limit or QL and detection limit and QL are estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted detection limit and adjusted detection limit and QL are estimated.

**UN:** Denotes analyte concentration is less than the QL and/or five times the blank concentration. Not reliably detected due to blank contamination.

**R:** Denotes result rejected.

**Q:** Denotes data validation qualifier.

**X:** Denotes mass spectral confirmation not obtained - result suspect.

**CAS#:** Denotes Chemical Abstract Services registration number.

**GPS:** Denotes Groundwater Protection Standards listed in Appendix K of Module VI-Groundwater Corrective Action & Monitoring Program for Unit 5 (approved by the VDEQ in the Final Class 3 Hazardous Waste Permit Modification dated November 5, 2009) which was incorporated into the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002).

**“-“:** Denotes not sampled.

# Comprehensive Data Validation Report

## Sample/Blind Field Duplicate Results Greater Than the Quantitation Limit

Facility: HWMU-5

Monitoring Event: Second Quarter 2011

Analyte	Sample ID	Laboratory	Validated	QL	Validation Notes
		Result (ug/L) Q	Result (ug/L) Q	(ug/L)	
Method: 6020A					
Laboratory: CompuChem, a Division of Liberty Analytical, Cary, NC					
Barium	5WC21	14.6	14.6	10	No action taken. Field duplicate RPD < 10.
	5WDUP	15.6	15.6	10	No action taken. Blind field duplicate for 5WC21.
Beryllium	5WC21	1.35	1.35	1	No action taken. Field duplicate RPD 12.
	5WDUP	1.52	1.52	1	No action taken. Blind field duplicate for 5WC21.
Cobalt	5WC21	61.9	61.9	5	No action taken. Field duplicate RPD < 10.
	5WDUP	65.1	65.1	5	No action taken. Blind field duplicate for 5WC21.
Nickel	5WC21	24.9	24.9	10	No action taken. Field duplicate RPD < 10.
	5WDUP	26.4	26.4	10	No action taken. Blind field duplicate for 5WC21.
Zinc	5WC21	32.8	32.8	10	No action taken. Field duplicate RPD < 10.
	5WDUP	32.2	32.2	10	No action taken. Blind field duplicate for 5WC21.
Method: 8260B					
Laboratory: Lancaster Laboratories, Lancaster, PA					
Chloroform	5WC21	5.1	5.1	1	No action taken. Field duplicate RPD < 10.
	5WDUP	5.1	5.1	1	No action taken. Blind field duplicate for 5WC21.
Trichloroethene	5WC21	4.9	4.9	1	No action taken. Field duplicate RPD < 10.
	5WDUP	4.8	4.8	1	No action taken. Blind field duplicate for 5WC21.

### Definitions:

#### Data Validation Qualifiers:

QL Denotes permit quantitation limit. Q Denotes data qualifier.

J Denotes analyte reported at or above quantitation limit and associated result is estimated.

Notes:

~ - TCE not detected above laboratory detection limit

J - Trichloroethene was detected at a concentration greater than the detection limit but less than the quantitation limit. These results are estimates only.

DRY - Monitoring wells 5WC22 and 5WC23 were dry during 3rd Quarter 2000. No samples were collected.

## Effectiveness Evaluation for MNA Remedy

1) Is the current MNA remedial timeframe prediction less than the 2019 MNA Goal?

## Status

yes

## Condition

If 'yes', then the remedy is considered effective and no additional action is required. If 'no' for three consecutive years, then contingency measures will be implemented as defined in the CAP.

2) Is the current MNA remedial timeframe prediction less than the 2026 MNA ineffective date?

yes

If 'yes', the remedy will be considered effective. If 'no' for three consecutive monitoring years, then an alternate remedial approach will be implemented as defined in the CAP.

## Effectiveness Evaluation for MNA Remedy

1) Is the current MNA remedial timeframe prediction less than the 2019 MNA Goal?

### Status

yes

### Condition

If 'yes', then the remedy is considered effective and no additional action is required. If 'no' for three consecutive years, then contingency measures will be implemented as defined in the CAP.

2) Is the current MNA remedial timeframe prediction less than the 2026 MNA ineffective date?

yes

If 'yes', the remedy will be considered effective. If 'no' for three consecutive monitoring years, then an alternate remedial approach will be implemented as defined in the CAP.

## **Target Analyte Monitoring Results - HWMU-7 Point of Compliance Wells Radford Army Ammunition Plant, Radford, Virginia**

**Upgradient well = 7W12B**

**All Results in ug/L.**

Analyte/Quarter	7W12B Q	7MW6 Q	7WCA Q	7W11B Q	QL	GPS	Background	Method
-----------------	---------	--------	--------	---------	----	-----	------------	--------

### **Definitions:**

**The following definitions apply to results reported for Appendix IX monitoring events.**

**All Appendix IX monitoring results for compliance wells are reported to the detection limit.**

QL Denotes permit required quantitation limit.

U denotes not detected at or above the detection limit.

UA denotes not detected at or above the adjusted detection limit.

J Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above the detection limit and detection limit and QL are estimated. When used with "UA"

(i.e., "UAJ"), denotes analyte not detected at or above adjusted detection limit and adjusted detection limit and QL are estimated.

UN Denotes analyte concentration is less than the quantitation limit and/or five times the blank concentration.

Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when compliance well results are reported to at or above the project detection limit.

R Denotes result rejected.

Q Denotes data validation qualifier.

**Background** Denotes background concentrations listed in the pending Class 3 Permit Modification for the Post-Closure Care Permit for HWMUs 5, 7, 10 and 16.

**CAS#** Denotes Chemical Abstract Services registration number.

**GPS** Denotes groundwater protection standard.

**The following definitions apply to results reported for non-Appendix IX monitoring events.**

**All non-Appendix IX monitoring results for compliance wells are reported to at or above the quantitation limit.**

QL Denotes permit required quantitation limit.

U Denotes analyte not detected at or above QL.

UA Denotes analyte not detected at or above adjusted sample QL.

J Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above QL and QL is estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated.

R Denotes result rejected.

Q Denotes data validation qualifier.

**Background** Denotes background concentrations listed in the pending Class 3 Permit Modification for the Post-Closure Care Permit for HWMUs 5, 7, 10 and 16.

**CAS#** Denotes Chemical Abstract Services registration number.

**GPS** Denotes groundwater protection standard.

### **Notes:**

#### **-Appendix IX Groundwater Monitoring Events:**

**Third Quarter 2003, Second Quarter 2004, Second Quarter 2005, Third Quarter 2006, Second Quarter 2007,**

**Second Quarter 2008, Second Quarter 2009, Second Quarter 2010, Second Quarter 2011**

All Appendix IX results evaluated and reported to detection limit.

-9/29/2003: Verification sampling event for 7MW6, 7W11B, 7W12B, 7WCA (copper and zinc).

Verification results reported in this table for copper and zinc.

-6/21-22/2004: Verification sampling event for 7MW6, 7W11B, 7W12B, 7WCA.

Verification results reported in this table for chloroform (7W12B).

-3/23/2005: Verification sampling event for 7MW6. Verification results reported in this table for bis(2-ethylhexyl)phthalate).

-7/26/2005: Verification sampling event for 7MW6, 7W11B, 7W12B, 7WCA (ethyl acetate), 7W11B (beta-BHC), and 7MW6 (alpha-BHC). All

Verification results reported as not detected. Verification results reported.

-Sept 2006: Verification sampling event for 7W12B and 7W11B 3Q2006 for chloroform. Initial results reported in this table for chloroform (7W11B,

-July 17, 2008: Verification sampling event for 7W13 arsenic and cobalt. 7W9C cobalt

-June 11, 2009, Verification sampling event for 7MW6 Diethyl ether. Analyte not detected. Verification results reported.

# Comprehensive Data Validation Report

## Sample/Blind Field Duplicate Results Greater Than the Quantitation Limit

Facility: HWMU-7

Monitoring Event: Second Quarter 2011

Analyte	Sample ID	Laboratory Result	Validated Result	QL	Validation Notes
		(ug/L) Q	(ug/L) Q	(ug/L)	
Method: 6020A					
Laboratory: CompuChem, a Division of Liberty Analytical, Cary, NC					
Barium	7WCA	27.1	27.1	10	No action taken. Field duplicate result was 26.0 ug/l. RPD <10.
	7WDUP	26	26	10	No action taken. Field duplicate of 7WCA. RPD <10.
Nickel	7WCA	10.7	10.7	10	No action taken. Field duplicate result was 10.0 ug/l. RPD <10.
	7WDUP	10	10	10	No action taken. Field duplicate of 7WCA. RPD <10.

Definitions: QL Denotes permit quantitation limit. Q Denotes data qualifier. J Denotes analyte reported at or above QL limit and associated result is estimated.

## Target Analyte Monitoring Results - HWMU-7 Point of Compliance Wells Radford Army Ammunition Plant, Radford, Virginia

Upgradient well = 7W12B

All Results in ug/L.

Analyte/Quarter	7W12B Q	7MW6 Q	7WCA Q	7W11B Q	QL	GPS	Background	Method
-----------------	---------	--------	--------	---------	----	-----	------------	--------

### Definitions:

*The following definitions apply to results reported for Appendix IX monitoring events.*

**All Appendix IX monitoring results for compliance wells are reported to the detection limit.**

**QL** Denotes permit required quantitation limit.

**U** denotes not detected at or above the detection limit.

**UA** denotes not detected at or above the adjusted detection limit.

**J** Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above the detection limit and detection limit and QL are estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted detection limit and adjusted detection limit and QL are estimated.

**UN** Denotes analyte concentration is less than the quantitation limit and/or five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when compliance well results are reported to at or above the project detection limit.

**R** Denotes result rejected.

**Q** Denotes data validation qualifier.

**Background** Denotes background concentrations listed in the pending Class 3 Permit Modification for the Post-Closure Care Permit for HWMUs 5, 7, 10 and 16.

**CAS#** Denotes Chemical Abstract Services registration number.

**GPS** Denotes groundwater protection standard.

*The following definitions apply to results reported for non-Appendix IX monitoring events.*

**All non-Appendix IX monitoring results for compliance wells are reported to at or above the quantitation limit.**

**QL** Denotes permit required quantitation limit.

**U** Denotes analyte not detected at or above QL.

**UA** Denotes analyte not detected at or above adjusted sample QL.

**J** Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above QL and QL is estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated.

**R** Denotes result rejected.

**Q** Denotes data validation qualifier.

**Background** Denotes background concentrations listed in the pending Class 3 Permit Modification for the Post-Closure Care Permit for HWMUs 5, 7, 10 and 16.

**CAS#** Denotes Chemical Abstract Services registration number.

**GPS** Denotes groundwater protection standard.

### Notes:

#### -Appendix IX Groundwater Monitoring Events:

**Third Quarter 2003, Second Quarter 2004, Second Quarter 2005, Third Quarter 2006, Second Quarter 2007, Second Quarter 2008, Second Quarter 2009, Second Quarter 2010, Second Quarter 2011**

All Appendix IX results evaluated and reported to detection limit.

-9/29/2003: Verification sampling event for 7MW6, 7W11B, 7W12B, 7WCA (copper and zinc).

Verification results reported in this table for copper and zinc.

-6/21-22/2004: Verification sampling event for 7MW6, 7W11B, 7W12B, 7WCA.

Verification results reported in this table for chloroform (7W12B).

-3/23/2005: Verification sampling event for 7MW6. Verification results reported in this table for bis(2-ethylhexyl)phthalate).

-7/26/2005: Verification sampling event for 7MW6, 7W11B, 7W12B, 7WCA (ethyl acetate), 7W11B (beta-BHC), and 7MW6 (alpha-BHC). All Verification results reported as not detected. Verification results reported.

-Sept 2006: Verification sampling event for 7W12B and 7W11B 3Q2006 for chloroform. Initial results reported in this table for chloroform (7W11B,

-July 17, 2008: Verification sampling event for 7W13 arsenic and cobalt. 7W9C cobalt

-June 11, 2009, Verification sampling event for 7MW6 Diethyl ether. Analyte not detected. Verification results reported.

**Definitions:**

*All plume monitoring well results reported to at or above the permit quantitation limit except for the upgradient well during the Appendix IX monitoring event. During the Appendix IX monitoring event, results for the upgradient well are reported to the detection limit.*

**Q** Denotes data validation qualifier.

**QL** Denotes permit required quantitation limit.

**U** Denotes analyte not detected at or above QL.

**UA** Denotes analyte not detected at or above adjusted sample QL.

**J** Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above QL and QL is estimated.

When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated.

**UN** Denotes analyte concentration is less than the quantitation limit and five times the blank concentration.

Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when compliance well results are reported to at or above the project detection limit.

**R** Denotes result rejected.

**Background** Denotes background concentrations listed in the pending Class 3 Permit Modification for the Post-Closure Care Permit for HWMUs 5, 7, 10 and 16.

**CAS#** Denotes Chemical Abstract Services registration number. **GPS** Denotes groundwater protection standard.

**Notes:**

-January 2005: Verification sampling event for 7MW13 4Q2004 arsenic. Verification results reported in this table for arsenic (7W13).

-March 2006: Verification sampling event for 7MW13 1Q2006 arsenic. Verification results reported in this table for arsenic (7W13).

-July 2006: Verification sampling event for 7MW13 2Q2006 arsenic. Verification results reported in this table for arsenic (7W13).

-Sept 2006: Verification sampling event for 7W12B 3Q2006 chloroform. Initial results reported in this table for chloroform (7W12B).

-July 17, 2007: Verification sampling event for 7W13 arsenic-verification event result reported, highest of four quadruplicate results, 7W13 cobalt-original result reported.. 7W9C cobalt- Verification result reported.

-Dec 17, 2008: Verification sampling event for 7W13 . cobalt- Original result reported.

-June 28, 2010 - Verification sampling event for 7W13 . cobalt- Original result reported.

Also, verification sampling event for 7W13 . cobalt- verification result reported.

-Dec 16, 2010 - Verification sampling event for 7W13 . arsenic- Verification result reported.

- June 27, 2011 - Verification sampling event for 7MW6 benzene and diethyl ether and 7W11B - Benzene - Verification result reported.

DRAPER ADEN ASSOCIATES (DAA) PREPARED THIS DOCUMENT (WHICH MAY INCLUDE DRAWINGS, SPECIFICATIONS, REPORTS, STUDIES AND ATTACHMENTS) IN ACCORDANCE WITH THE AGREEMENT BETWEEN DAA AND ALLIANT TECHSYSTEMS INC.

THE STANDARD OF CARE FOR ALL PROFESSIONAL ENGINEERING, ENVIRONMENTAL AND SURVEYING AND RELATED SERVICES PERFORMED OR FURNISHED BY DAA UNDER THIS AGREEMENT ARE THE CARE AND SKILL ORDINARILY USED BY MEMBERS OF THESE PROFESSIONS PRACTICING UNDER SIMILAR CIRCUMSTANCES AT THE SAME TIME AND IN THE SAME LOCALITY. DAA MAKES NO WARRANTIES, EXPRESS OR IMPLIED, UNDER THIS AGREEMENT IN CONNECTION WITH DAA'S SERVICES.

CONCLUSIONS PRESENTED ARE BASED UPON A REVIEW OF AVAILABLE INFORMATION, THE RESULTS OF OUR FIELD STUDIES, AND/OR PROFESSIONAL JUDGMENT. TO THE BEST OF OUR KNOWLEDGE, INFORMATION PROVIDED BY OTHERS IS TRUE AND ACCURATE, UNLESS OTHERWISE NOTED.

DAA'S LIABILITY, HEREUNDER, SHALL BE LIMITED TO AMOUNTS DUE DAA FOR SERVICES ACTUALLY RENDERED, OR REIMBURSABLE EXPENSES ACTUALLY INCURRED.

ANY REUSE OR MODIFICATION OF ANY OF THE AFOREMENTIONED DOCUMENTS (WHETHER HARD COPIES OR ELECTRONIC TRANSMITTALS) PREPARED BY DAA WITHOUT WRITTEN VERIFICATION OR ADAPTATION BY DAA WILL BE AT THE SOLE RISK OF THE INDIVIDUAL OR ENTITY UTILIZING SAID DOCUMENTS AND SUCH USE IS WITHOUT THE AUTHORIZATION OF DAA. DAA SHALL HAVE NO LEGAL LIABILITY RESULTING FROM ANY AND ALL CLAIMS, DAMAGES, LOSSES, AND EXPENSES, INCLUDING ATTORNEY'S FEES ARISING OUT OF THE UNAUTHORIZED REUSE OR MODIFICATION OF THESE DOCUMENTS. CLIENT SHALL INDEMNIFY DAA FROM ANY CLAIMS ARISING OUT OF UNAUTHORIZED USE OR MODIFICATION OF THE DOCUMENTS WHETHER HARD COPY OR ELECTRONIC.

CONCLUSIONS PRESENTED BY DAA DO NOT REFLECT VARIATIONS IN SUBSURFACE GROUNDWATER QUALITY THAT MIGHT EXIST BETWEEN OR BEYOND SAMPLING POINTS OR BETWEEN SPECIFIC SAMPLE COLLECTIONS EVENTS. DAA SHALL INCUR NO LIABILITY RESULTING FROM INFORMATION SUPPLIED BY OTHERS.

## **RADFORD ARMY AMMUNITION PLANT – HWMU-7 CALCULATION OF CONSTITUENT BACKGROUND VALUES**

Draper Aden Associates recalculated background values for the plume monitoring well constituents of the groundwater monitoring program for Hazardous Waste Management Unit No. 7 (HWMU-7) located at the Radford Army Ammunition Plant (Radford AAP) in Radford, Virginia. Background values were calculated for all plume monitoring well constituents.

The background values for HWMU-7 plume monitoring well constituents were calculated using the analytical data for upgradient well 7W12B using data from Second Quarter 2003 through Second Quarter 2007 (available most recent data with one exception-cyanide includes 4th Quarter 2007 data). Inter-well upper prediction limits (UPL) were calculated on the background data for the target parameters in accordance with the facility permit and VHWMR (40 CFR 264.97(h)). Where applicable, the background value calculations were based on site-wide 95% confidence, 95% coverage upper prediction intervals. The calculated background values for all target constituents are listed on **Table 1**.

### **Background Data and Background Value Calculations**

The constituents listed below were 100% non-detected (<LOQ) in the background well. The background values for these constituents were established as equal to their quantitation limits (QL).

<b>Background Value = Quantitation Limit (QL)</b>				
<b>Constituent</b>	<b>Sample Size</b>	<b>% Non-Detects</b>	<b>QL (µg/l)</b>	<b>Background Value (µg/l)</b>
Antimony	17	100	1	1
Arsenic	17	100	10	10
Cadmium	17	100	1	1
Cobalt	17	100	5	5
Copper	16	100	5	5
Lead	17	100	1	1
Mercury	17	100	2	2
Nickel	17	100	10	10
Selenium	17	100	10	10
Silver	17	100	2	2
Thallium	17	100	1	1
Cyanide	18	100	20	20
Bis(2-ethylhexyl)phthalate	17	100	6	6
Butyl benzyl phthalate	17	100	10	10
2,4-Dinitrophenol	17	100	10	10
2,4-Dinitrotoluene	17	100	10	10
2,6-Dinitrotoluene	17	100	10	10
p-Nitrophenol	17	100	10	10

Non-parametric prediction intervals were computed for the constituents for which the data from upgradient well 7W-12B satisfied one of the following two criteria, per VDEQ regulations and guidance as well as USEPA guidance:

- Percentage of non-detects was greater than or equal to 50 and less than 100; or
- Percentage of non-detects was less than 50, but data was not normally distributed in original or log-transformed mode.

Only one result for zinc was reported above its LOQ. The reported result (10.9 µg/l) is the NUPL for zinc. The non-parametric prediction limit computation for chromium is presented in **Appendix A**.

<b>Background Value = UPL of Non-parametric Prediction Interval (NUPL)</b>					
<b>Parameter</b>	<b>Sample Size</b>	<b>% Non-Detects</b>	<b>QL (µg/l)</b>	<b>NUPL (µg/l)</b>	<b>Background Value (µg/l)</b>
Chromium	17	12	5	9.9	9.9
Zinc	14	93	10	10.9	10.9

The following constituent (barium) exhibited normally distributed background data with less than 0% non-detects. One sided parametric prediction interval was computed on the background data for barium. The background value for barium was set as equal to its UPL. The background concentration calculations were based on a site wide 95% confidence, 95% coverage upper prediction intervals. The background and relevant statistical data for barium is summarized below. The prediction interval computation is presented in **Appendix A**.

<b>Background Value = UPL of one-sided Prediction Interval</b>					
<b>Parameter</b>	<b>Sample Size</b>	<b>% Non-Detects</b>	<b>QL (µg/l)</b>	<b>UPL (µg/l)</b>	<b>Background Value (µg/l)</b>
Barium	17	0	10	41.0	41.0

**TABLE 1**  
**HWMU-7**  
**CALCULATED BACKGROUND VALUES**

Constituent	Background Value (µg/l unless otherwise noted)
Antimony	1
Arsenic	10
Barium	41.0
Cadmium	1
Chromium	9.9
Cobalt	5
Copper	5
Lead	1
Mercury	2
Nickel	10
Selenium	10
Silver	2
Thallium	1
Zinc	10.9
Cyanide	20
Bis(2-ethylhexyl)phthalate	6
Butyl benzyl phthalate	10
2,4-Dinitrophenol	10
2,4-Dinitrotoluene	10
2,6-Dinitrotoluene	10
p-Nitrophenol	10

## **APPENDIX A**

### **HWMU-7**

#### **BACKGROUND VALUE CALCULATIONS**

#### **STATISTICAL COMPUTATIONS FOR BARIUM AND CHROMIUM**

**RAAP-HWMU-7 - Background Calculation - December 2007**  
17-Dec-07

Y2K Correction dates are as shown in table below.

Actual Event		Date Used in Stat Software
2003-Qtr2		8/1/1999
2003-Qtr3		8/2/1999
2003-Qtr4		8/3/1999
2004-Qtr1		8/4/1999
2004-Qtr2		8/5/1999
2004-Qtr3		8/6/1999
2004-Qtr4		8/7/1999
2005-Qtr1		8/8/1999
2005-Qtr2		8/9/1999
2005-Qtr3		8/10/1999
2005-Qtr4		8/11/1999
2006-Qtr1		8/12/1999
2006-Qtr2		8/13/1999
2006-Qtr3		8/14/1999
2006-Qtr4		8/15/1999
2007-Qtr1		8/16/1999
2007-Qtr2		8/17/1999

**Notes:**

1) Background data was computed for all target constituents using the 2Q 2003 - 2Q 2007 data for background well 7W12B. Background data was 100% <LOQ for all target parameters except barium, chromium and zinc. Zinc had only one reported result > LOQ.

Statistical computations using GRITS/STAT V5.0 performed only for barium and chromium, as applicable.

Analyte/Quarter	10D4 Q	10D3 Q	10D3D Q	10DDH2R Q	10MW1 Q	QL	GPS	Method
<p><b>Definitions:</b></p> <p>QL Denotes permit required quantitation limit.  U Denotes analyte not detected at or above QL.  UA Denotes analyte not detected at or above adjusted sample QL.  J Denotes associated result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above QL and QL is estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated.  UN Denotes analyte concentration is less than the quantitation limit and five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when results are reported to at or above the detection limit.  R Denotes result rejected.  Q Denotes data validation qualifier.  CAS# Denotes Chemical Abstract Services registration number.  GPS Denotes Groundwater Protection Standards listed in Appendix G to Attachment 4 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002).  For cobalt, vanadium, acetone and 2-propanol, these analytes are not listed in Appendix VIII to 40 CFR Part 261; therefore, GPSs will not be established for these constituents.  NS denotes not sampled.  NA denotes not analyzed.  "--" denotes not detected (pre-2nd Quarter 2003) or not available / not sampled (beginning 2nd Quarter 2003).</p> <p><b>Appendix IX Monitoring Events:</b>  <i>First Quarter 2003,</i>  <i>Second Quarter: 2004, 2005, 2007, 2008, 2009, 2010, 2011</i>  <i>Third Quarter 2006</i></p> <p>For Appendix IX monitoring, compliance well results reported/evaluated to detection limit. See data validation Qualifier definitions noted below.</p> <p><b>The following definitions apply to results reported for Appendix IX monitoring events.</b>  <b>All Appendix IX monitoring results for compliance wells are reported to the detection limit.</b></p> <p>QL Denotes permit required quantitation limit.  U denotes not detected at or above the detection limit or QL.  UA denotes not detected at or above the adjusted detection limit or adjusted QL.  J Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above the detection limit or QL and detection limit and QL are estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted detection limit or adjusted QL and adjusted detection limit and adjusted QL are estimated.  UN Denotes analyte concentration is less than the quantitation limit and/or five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when compliance well results are reported to at or above the project detection limit.</p> <p>Verification events: 12/12/03, 06/17/04, 7/25/2005.  6/17/04. Verification event. Acetone: 10D3D was not detected during verification event. Verification event result reported.  7/25/05. Verification event. All wells: ethyl acetate. 10D3D: alpha-BHC, acetone and 2-propanol. All verification results: Not detected except for acetone and 2-propanol. Verification results presented in table.  7/17/2008. Verification event. 10MW1. Technical chlordane, diethyl phthalate. Verification results reported-all not detected.  6/11/2009 - Verification event, 10DDH2R, Diethyl ether, Verification results reported in table-all not detected.</p>								

# Comprehensive Data Validation Report

## Sample/Blind Field Duplicate Results Greater Than the Quantitation Limit

Facility: HWMU-10

Monitoring Event: Second Quarter 2011

Analyte	Sample ID	Laboratory Result	Validated Result	QL	Validation Notes
		(ug/L) Q	(ug/L) Q	(ug/L)	
Method: 6020A					
Laboratory: CompuChem, a Division of Liberty Analytical, Cary, NC					
Barium	10D3	85	85	10	No action taken. Field duplicate result was 84.9 ug/l. RPD <10.
	10DUP	84.9	84.9	10	No action taken. Field duplicate of 10D3. RPD <10.
Zinc	10D3	10.4	10.4	10	No action taken. Field duplicate result was 11.8 ug/l. 13 RPD.
	10DUP	11.8	11.8	10	No action taken. Field duplicate of 10D3. 13 RPD.
Method: 8260B					
Laboratory: Lancaster Laboratories, Lancaster, PA					
Chloroform	10D3	4.2	4.2	1	No action taken. Field duplicate result was 4.2 ug/l. RPD <10.
	10DUP	4.2	4.2	1	No action taken. Field duplicate of 10D3. RPD <10.

### Definitions:

QL Denotes permit quantitation limit.

Q Denotes data qualifier.

J Denotes analyte reported at or above QL and associated result is estimated.

## Target Analyte Monitoring Results - HWMU-10 Point of Compliance Wells

### Radford Army Ammunition Plant, Radford, Virginia

Upgradient well = 10D4

All Results in ug/L.

Analyte/Quarter	10D4 Q	10D3 Q	10D3D Q	10DDH2R Q	10MW1 Q	QL	GPS	Method
<p><b>Definitions:</b></p> <p><b>QL</b> Denotes permit required quantitation limit.</p> <p><b>U</b> Denotes analyte not detected at or above QL.</p> <p><b>UA</b> Denotes analyte not detected at or above adjusted sample QL.</p> <p><b>J</b> Denotes associated result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above QL and QL is estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated.</p> <p><b>UN</b> Denotes analyte concentration is less than the quantitation limit and five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when results are reported to at or above the detection limit.</p> <p><b>R</b> Denotes result rejected.</p> <p><b>Q</b> Denotes data validation qualifier.</p> <p><b>CAS#</b> Denotes Chemical Abstract Services registration number.</p> <p><b>GPS</b> Denotes Groundwater Protection Standards listed in Appendix G to Attachment 4 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002). For cobalt, vanadium, acetone and 2-propanol, these analytes are not listed in Appendix VIII to 40 CFR Part 261; therefore, GPSs will not be established for these constituents.</p> <p><b>NS</b> denotes not sampled.</p> <p><b>NA</b> denotes not analyzed.</p> <p>"--" denotes not detected (pre-2nd Quarter 2003) or not available / not sampled (beginning 2nd Quarter 2003).</p> <p><b>Appendix IX Monitoring Events:</b> <i>First Quarter 2003,</i> <i>Second Quarter: 2004, 2005, 2007, 2008, 2009, 2010, 2011</i> <i>Third Quarter 2006</i></p> <p>For Appendix IX monitoring, compliance well results reported/evaluated to detection limit. See data validation Qualifier definitions noted below.</p> <p><b>The following definitions apply to results reported for Appendix IX monitoring events.</b> <b>All Appendix IX monitoring results for compliance wells are reported to the detection limit.</b></p> <p><b>QL</b> Denotes permit required quantitation limit.</p> <p><b>U</b> denotes not detected at or above the detection limit or QL.</p> <p><b>UA</b> denotes not detected at or above the adjusted detection limit or adjusted QL.</p> <p><b>J</b> Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above the detection limit or QL and detection limit and QL are estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted detection limit or adjusted QL and adjusted detection limit and adjusted QL are estimated.</p> <p><b>UN</b> Denotes analyte concentration is less than the quantitation limit and/or five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when compliance well results are reported to at or above the project detection limit.</p>

Radford Army Ammunition Plant, Radford, Virginia**

Upgradient well = 16C1

All Results in ug/L.

Analyte/Quarter	16C1	16MW8	16MW9	16WC1A	16WC1B	OL	GPS	Method
-----------------	------	-------	-------	--------	--------	----	-----	--------

**Definitions:**

*The following definitions apply to results reported for Appendix IX monitoring events.*

*All Appendix IX monitoring results for compliance wells are reported to the detection limit.*

**Appendix IX Monitoring Events:** 3Q2003, 2Q-2004, 2Q-2005, 3Q2006, 2Q2007, 2Q2008, 2Q2009, 2Q 2010, 2Q 2011

QL Denotes permit required quantitation limit.

U denotes not detected at or above the detection limit.

UA denotes not detected at or above the adjusted detection limit.

J Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above the detection limit and detection limit and QL are estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted detection limit and adjusted detection limit and QL are estimated.

UN Denotes analyte concentration is less than the quantitation limit and/or five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when compliance well results are reported to at or above the project detection limit.

R Denotes result rejected.

Q Denotes data validation qualifier. X Denotes mass spectral confirmation not obtained-result suspect.

Background Denotes background concentrations listed in Appendix F to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002), where applicable.

CAS# Denotes Chemical Abstract Services registration number.

GPS Denotes Groundwater Protection Standards listed in Appendix G to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002).

NS denotes not sampled. NA denotes not analyzed.

"—" denotes not detected (pre-2nd Quarter 2003) or not available / not sampled (beginning 2nd Quarter 2003).

*The following definitions apply to results reported for non-Appendix IX monitoring events.*

*All non-Appendix IX monitoring results for compliance wells are reported at or above the quantitation limit.*

QL Denotes permit required quantitation limit.

U Denotes analyte not detected at or above QL.

UA Denotes analyte not detected at or above adjusted sample QL.

J Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above QL and QL is estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated.

R Denotes result rejected.

Q Denotes data validation qualifier.

Background Denotes background concentrations listed in Appendix F to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002), where applicable.

CAS# Denotes Chemical Abstract Services registration number.

GPS Denotes Groundwater Protection Standards listed in Appendix G to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002).

**NOTE:**

Fourth Quarter 2008:

Due to laboratory error all HWMU 16 samples were analyzed using Method 8260B 5 ml purge instead of a 25 ml purge which resulted in a higher QL. For these samples, all results were evaluated to the detection limit, which is comparable to the permit QL. Results below the laboratory QL but at or above the permit QL are reported and qualified as estimated.

Second Quarter 2009:

Verification event 6/11/2009 - 16MW8 for acetone. Verification result reported as not detected.

4/2010 event -Per DEQ, tin analyzed by Method 6010B instead of Method 6020. Verification event: 16MW9 1,1-dichloroethene and benzene. 16WC1B 4,4-DDD. Verification result reported as not detected.

# Comprehensive Data Validation Report

## Sample/Blind Field Duplicate Results Greater Than the Quantitation Limit

Facility: HWMU-16

Monitoring Event: Second Quarter 2011

Analyte	Sample ID	Laboratory Result (ug/L) Q	Validated Result (ug/L) Q	QL (ug/L)	Validation Notes
<b>Method: 6020A</b>					
<b>Laboratory: CompuChem, a Division of Liberty Analytical, Cary, NC</b>					
Barium	16WC1A	308	308	10	No action taken. Field duplicate result was 305 ug/l. RPD <10.
	16WDUP	305	305	10	No action taken. Field duplicate of 16WC1A. RPD <10.
Cobalt	16WC1A	9.24	9.24	5	No action taken. Field duplicate result was 8.02 ug/l. 14 RPD.
	16WDUP	8.02	8.02	5	No action taken. Field duplicate of 16WC1A. 14 RPD.
Zinc	16WC1A	11.2	11.2	10	No action taken. Field duplicate result was < QL. RPD is not calculable.
<b>Method: 8260B</b>					
<b>Laboratory: Lancaster Laboratories, Lancaster, PA</b>					
1,1-Dichloroethane	16WC1A	2.3	2.3	1	No action taken. Field duplicate result 2.3 ug/l. RPD <10.
	16WDUP	2.3	2.3	1	No action taken. Field duplicate of 16WC1A. RPD <10.

### Definitions:

#### Data Validation Qualifiers:

QL Denotes permit quantitation limit. Q Denotes data qualifier.

J Denotes analyte reported at or above quantitation limit and associated result is estimated.

**Target Analyte Monitoring Results - HWMU-16 Point of Compliance Wells**  
**Radford Army Ammunition Plant, Radford, Virginia**  
*Upgradient well = 16C1*

*All Results in ug/L.*

Analyte/Quarter	16C1	16MW8	16MW9	16WC1A	16WC1B	OL	GPS	Method
-----------------	------	-------	-------	--------	--------	----	-----	--------

**Definitions:**

*The following definitions apply to results reported for Appendix IX monitoring events.*

*All Appendix IX monitoring results for compliance wells are reported to the detection limit.*

**Appendix IX Monitoring Events:** 3Q2003, 2Q-2004, 2Q-2005, 3Q2006, 2Q2007, 2Q2008, 2Q2009, 2Q 2010, 2Q 2011

**QL** Denotes permit required quantitation limit.

**U** denotes not detected at or above the detection limit.

**UA** denotes not detected at or above the adjusted detection limit.

**J** Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above the detection limit and detection limit and QL are estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted detection limit and adjusted detection limit and QL are estimated.

**UN** Denotes analyte concentration is less than the quantitation limit and/or five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when compliance well results are reported to at or above the project detection limit.

**R** Denotes result rejected.

**Q** Denotes data validation qualifier. **X** Denotes mass spectral confirmation not obtained-result suspect.

**Background** Denotes background concentrations listed in Appendix F to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002), where applicable.

**CAS#** Denotes Chemical Abstract Services registration number.

**GPS** Denotes Groundwater Protection Standards listed in Appendix G to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002).

**NS** denotes not sampled. **NA** denotes not analyzed.

**“--“** denotes not detected (pre-2nd Quarter 2003) or not available / not sampled (beginning 2nd Quarter 2003).

*The following definitions apply to results reported for non-Appendix IX monitoring events.*

*All non-Appendix IX monitoring results for compliance wells are reported at or above the quantitation limit.*

**QL** Denotes permit required quantitation limit.

**U** Denotes analyte not detected at or above QL.

**UA** Denotes analyte not detected at or above adjusted sample QL.

**J** Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above QL and QL is estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated.

**R** Denotes result rejected.

**Q** Denotes data validation qualifier.

**Background** Denotes background concentrations listed in Appendix F to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002), where applicable.

**CAS#** Denotes Chemical Abstract Services registration number.

**GPS** Denotes Groundwater Protection Standards listed in Appendix G to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002).

**NOTE:**

Fourth Quarter 2008:

Due to laboratory error all HWMU 16 samples were analyzed using Method 8260B 5 ml purge instead of a 25 ml purge which resulted in a higher QL. For these samples, all results were evaluated to the detection limit, which is comparable to the permit QL. Results below the laboratory QL but at or above the permit QL are reported and qualified as estimated.

Second Quarter 2009:

Verification event 6/11/2009 - 16MW8 for acetone. Verification result reported as not detected.

4/ 2010 event -Per DEQ, tin analyzed by Method 6010B instead of Method 6020. Verification event: 16MW9 1,1-dichloroethene and benzene. 16WC1B 4,4-DDD. Verification result reported as not detected.

# Target Analyte Monitoring Results At Or Above Permit Quantitation Limit HWMU-16 Plume Monitoring Wells

Radford Army Ammunition Plant, Radford, Virginia

All Results in ug/L.

Upgradient well = 16C1

Analyte/Quarter	16C1 Q	16-1 Q	16-2 Q	16-3 Q	16-5 Q	16WC2B Q	16SPRING Q	QL	Background	Method
-----------------	--------	--------	--------	--------	--------	----------	------------	----	------------	--------

## Definitions:

All plume monitoring well results reported to at or above the permit quantitation limit except for the upgradient well during the Appendix IX monitoring Event. During this event, results for the upgradient well are reported to the detection limit.

Q Denotes data validation qualifier.

QL Denotes permit required quantitation limit.

U Denotes analyte not detected at or above QL.

UA Denotes analyte not detected at or above adjusted sample QL.

J Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above QL and QL is estimated.

When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated.

UN Denotes analyte concentration is less than the quantitation limit and five times the blank concentration.

Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when compliance well results are reported to at or above the project detection limit.

R Denotes result rejected.

**Background** Denotes background concentrations listed in Appendix F to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002).

**CAS#** Denotes Chemical Abstract Services registration number.

**GPS** Denotes groundwater protection standard.

NS denotes not sampled. NA denotes not analyzed. "--"denotes not detected (pre-2nd Quarter 2003) or not available / not sampled (beginning 2nd Quarter 2003).

## Notes:

4Q2004. No data for 16-1 8270C-semivolatiles. Well dry-insufficient sample volume.

4Q2006 - No data for 16-1; well dry.

4Q2008- No data for 16-1; well dry.

2Q2009- No data for 16-1; well dry.

## NOTE:

Fourth Quarter 2008

Due to laboratory error all HWMU 16 samples were analyzed using Method 8260B 5 ml purge instead of a 25 ml purge which resulted in a higher QL. For these samples, all results were evaluated to the detection limit, which is comparable to the permit QL. Results below the laboratory QL but at or above the permit QL are reported and qualified as estimated.

Fourth Quarter 2011	U	U	U	U	U	U	U	1	1.2	8260B
<b>Xylenes (Total)</b> CAS # 1330-20-7										
Fourth Quarter 2011	U	U	U	U	U	U	U	3	0.2	8260B

**Definitions:**

*All plume monitoring well results reported to at or above the permit quantitation limit except for the upgradient well during the Appendix IX monitoring Event. During this event, results for the upgradient well are reported to the detection limit.*

**Q** Denotes data validation qualifier.

**QL** Denotes permit required quantitation limit.

**U** Denotes analyte not detected at or above QL.

**UA** Denotes analyte not detected at or above adjusted sample QL.

**J** Denotes result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above QL and QL is estimated.

When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated.

**UN** Denotes analyte concentration is less than the quantitation limit and five times the blank concentration.

Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when compliance well results are reported to at or above the project detection limit.

**R** Denotes result rejected.

**Background** Denotes background concentrations listed in Appendix F to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002).

**CAS#** Denotes Chemical Abstract Services registration number.

**GPS** Denotes groundwater protection standard.

**NS** denotes not sampled. **NA** denotes not analyzed. "--"denotes not detected (pre-2nd Quarter 2003) or not available / not sampled (beginning 2nd Quarter 2003).

**Notes:**

4Q2004. No data for 16-1 8270C-semivolatiles. Well dry-insufficient sample volume.

4Q2006 - No data for 16-1; well dry.

4Q2008- No data for 16-1; well dry.

2Q2009- No data for 16-1; well dry.

**NOTE:**

Fourth Quarter 2008

Due to laboratory error all HWMU 16 samples were analyzed using Method 8260B 5 ml purge instead of a 25 ml purge which resulted in a higher QL. For these samples, all results were evaluated to the detection limit, which is comparable to the permit QL. Results below the laboratory QL but at or above the permit QL are reported and qualified as estimated.

#### **APPENDIX D-4**

#### **ESTABLISHED BACKGROUND VALUES AND COMPUTATIONS FOR HWMU-16**

#### **APPENDIX D-4**

#### **ESTABLISHED BACKGROUND VALUES AND COMPUTATIONS FOR HWMU-16**

- It was not understood why the majority of fluorescein detections were considered false positive detections. The basis of this observation is unclear considering a lack of background and laboratory confirmation results.
- It was not apparent why certain samples were selected for laboratory confirmation and others were not. There was no apparent consistency in the selection of samples for laboratory confirmation.
- Samples were submitted for confirmation laboratory analyses three months or more following the collection of the samples in the field. No information was provided regarding the custody and/or storage of the samples. The samples were submitted to the analytical laboratory with incomplete chain-of-custody (COC), and the COC documentation was not completed by the laboratory.

In summary, the data from the study do not provide the basis for meaningful interpretation. Any attempt to formulate conclusions from the data as presented regarding the presence of preferred or predominant groundwater flow patterns is not warranted or recommended.

### 3.3 HWMU-16 GROUNDWATER MONITORING ANALYTE LIST

The groundwater monitoring analyte list for HWMU-16 is presented in **Table 1 (Appendix B)**. The list represents the subset of the constituents listed in Appendix III of 40 CFR Part 261 that previously have been detected in the groundwater and/or that are reasonably expected to be in or derived from waste contained in HWMU-16. As discussed in Section 3.5.2 below, 12 inorganic constituents and two explosive/propellant constituents have been detected in the groundwater monitoring network for HWMU-16 at statistically significant concentrations above the Unit's calculated background concentrations. The inorganic constituents may be derived from the aquifer formation materials; however, the two explosive/propellant constituents (2,4-Dinitrotoluene and 2,6-Dinitrotoluene) are byproducts of wastes derived from explosives. Therefore, the two explosive/propellant constituents detected could only be from HWMU-16.

The concentration limits established for the hazardous constituents also are listed in **Table 1**. The concentration limits represent either background concentrations calculated for the constituents in this GWQAR, Maximum Concentrations of Constituents for Ground-water Protection listed in Table 1 of 40 CFR 264.94, USEPA Drinking Water Standard Maximum Contaminant Levels (MCLs), or alternate concentration limits (ACLs) established by the VDEQ (July 1998). Certain organic constituents on the list do not have USEPA MCLs or VDEQ ACLs; they also do not have calculated background concentrations because they have not been detected in the Unit's upgradient well. Therefore, the concentration limits for these constituents are equal to their respective method detection limits.

As Alliant discussed with the VDEQ in the past, the reliability of previous laboratory analytical data - particularly dissolved metals data - appeared to be questionable in some cases. In an April 9, 1996 letter to C. Jake (Alliant), the VDEQ agreed that only total metals concentrations in groundwater would be measured, as described in a USEPA Region III guidance on groundwater sampling in karst terrain. Therefore, all references to metals concentrations in this GWQAR refer to total metals concentrations.

### 3.4 HWMU-16 GROUNDWATER BACKGROUND CONCENTRATIONS

Background concentrations were calculated for each constituent in the groundwater monitoring program using the analytical data from 1996 through 1998 for upgradient well 16C1.

The background concentration calculations were based on site wide 95% confidence, 95% coverage upper prediction intervals. The calculated background concentrations are listed in Table 2 (Appendix B). The background concentrations were used to construct the outermost closing contours on the Isoconcentration Maps (Appendix A).

### 3.5 HWMU-16 STATISTICAL ANALYSIS

Statistical evaluations for HWMU-16 are performed annually and submitted to the VDEQ in accordance with the annual reporting requirements specified in 40 CFR 265.94. As part of this GWQAR, statistical evaluations were performed on Fourth Quarter 1998 analytical data in accordance with the procedures and guidance provided in the following documents:

- Title 40 of the Code of Federal Regulations, 40 CFR 264.97 and 264.98;
- VDEQ Guidance for statistical analysis titled "Data Analysis Plan," undated;
- Interim Final Guidance for Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, USEPA, April 1989;
- Addendum to Interim Final Guidance for Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities, USEPA, July 1992; and
- Statistical Methods for Groundwater Monitoring, Gibbons, R.D., 1994.

Statistical threshold values were computed for the 54 constituents for which HWMU-16 is currently monitored based on the concentrations of those constituents in upgradient (background) well 16C1. All data starting with First Quarter 1996 to Fourth Quarter 1998 were used for this purpose. The 1996 through 1998 monitoring data have been submitted previously to the VDEQ by Alliant in quarterly monitoring reports; therefore, the data are not listed in this GWQAR. Statistical comparisons were performed for the Fourth Quarter 1998 data set. Comparison statistical analyses were performed for all constituents which were detected in any downgradient well during that event.

#### 3.5.1 Background Data and Statistical Comparisons

Statistical analyses were performed using the analytical results from upgradient well 16C1 data as background data. Based on the percentage of non-detects and the distribution of the background data, methods of statistical comparisons varied. Background average, standard deviation and other descriptive statistical data were computed for all constituents and are presented in Appendix C.

The constituents listed below were 100% non-detected in the background data. The background threshold levels (BTLs) for these constituents were established as equal to their detection limits (DL). Detections of these constituents in the downgradient wells during Fourth Quarter 1998 were compared to these BTLs.

Background Threshold Level (BTL) = Detection Limit (DL)				
Parameter	Sample Size	% Non-Detects	DL (µg/l)	BTL (µg/l)
Antimony	12	100	3	3
Arsenic	12	100	1	1
Bromoform	12	100	0.3	0.3
Carbon tetrachloride	12	100	0.2	0.2
Chlorobenzene	12	100	0.1	0.1
Chloromethane	12	100	0.3	0.3
Cyanide	12	100	10	10

Background Threshold Level (BTL) = Detection Limit (DL)				
Parameter	Sample Size	% Non-Detects	DL (µg/l)	BTL (µg/l)
Di-n-butyl phthalate	12	100	5	5
1,2-Dichloroethane	12	100	0.1	0.1
trans-1,2-Dichloroethene	12	100	0.1	0.1
1,4-Dichlorobenzene	12	100	0.1	0.1
Ethylbenzene	12	100	0.1	0.1
Mercury	12	100	0.2	0.2
Methyl ethyl ketone	12	100	1.1	1.1
Selenium	12	100	1	1
1,1,2,2-Tetrachloroethane	12	100	0.3	0.3
1,1,2-Trichloroethane	12	100	0.5	0.5
Trichloroethene	12	100	0.1	0.1
Toluene	12	100	0.1	0.1
2378-TCDF	12	100	0.0485 ppt	0.0485 ppt
12378-PECDF	12	100	0.0439 ppt	0.0439 ppt
23478-PECDF	12	100	0.0417 ppt	0.0417 ppt
123478-HXCDF	12	100	0.0390 ppt	0.0390 ppt
123678-HXCDF	12	100	0.0377 ppt	0.0377 ppt
234678-HXCDF	12	100	0.0428 ppt	0.0428 ppt
123789-HXCDF	12	100	0.0415 ppt	0.0415 ppt
1234678-HPCDF	12	100	0.0615 ppt	0.0615 ppt
1234789-HPCDF	12	100	0.0709 ppt	0.0709 ppt
OCDF	12	100	0.1307 ppt	0.1307 ppt

Non-parametric prediction intervals were computed for all of the constituents for which the data from background well 16C1 satisfied one of the following two criteria, per VDEQ regulations and guidance as well as USEPA guidance:

- Percentage of non-detects was greater than or equal to 50 and less than 100; or
- Percentage of non-detects was less than 50, but data was not normally distributed in original or log-transformed mode.

The background threshold levels for these constituents were set as equal to their upper prediction limits (UPLs). The background and relevant statistical data for these constituents are summarized below. The confidence level and false positive rate were calculated based on the number of background data points available and number of future comparisons. For all constituents, the confidence level was determined to be equal to 0.933, and the false positive rate was equal to 0.067. Since the upper control limit of a non-parametric interval cannot be adjusted for multiple comparisons and inadequate number of background data, the number of resampling events required was adjusted to account for the high error rates inherent in those situations. The number of confirmation resamples required for all constituents is 2. The background and relevant statistical data for these constituents are summarized below. Associated statistical computations are presented in **Appendix C**.

BTL = Upper Prediction Limit of Non-parametric Prediction Interval w/false positive rate=0.067				
Parameter	Sample Size	% Non-Detects	DL (µg/l)	BTL (µg/l)
Beryllium	12	75	0.2	0.7
Cadmium	12	75	0.1	0.2
Cobalt	12	75	1	5
Copper	12	50	1	13
1,1-Dichloroethane	12	0	0.2	9.5
2,4-Dinitrotoluene	12	92	0.08	0.10

BTL = Upper Prediction Limit of Non-parametric Prediction Interval w/false positive rate=0.067				
Parameter	Sample Size	% Non-Detects	DL (µg/l)	BTL (µg/l)
2,6-Dinitrotoluene	12	75	0.08	0.11
Lead	12	42	1	10
Nickel	12	92	15	16
Silver	12	75	0.2	0.5
Thallium	12	67	1	6
TOC	12	75	1000	7000
1,1,1-Trichloroethane	12	17	0.3	9.2
Vanadium	12	83	4	151
Vinyl Chloride	12	92	0.1	0.1
Xylene (total)	12	92	0.1	0.2
Zinc	12	50	5	51

Chromium exhibited normally distributed data (excluding non-detects) with between 25% and 50% non-detects in the background well. The mean and standard deviation of the background data for chromium were adjusted using Cohen's Maximum Likelihood Estimator Method (1959, 1961). A one-sided parametric prediction interval was then computed for chromium based on the adjusted mean and standard deviation. The Upper Prediction Limit was set as the BTL for chromium. The background and relevant statistical data for chromium are summarized below. Cohen's adjustment computations and prediction interval computations are presented in Appendix C.

BTL = Upper Prediction Limit of Prediction Interval w/false positive rate=0.05 Original Mean = 3.54, Original SD = 1.933 Adjusted Mean = 3.642, Adjusted SD = 1.95				
Parameter	Sample Size	% Non-Detects	DL (µg/l)	BTL (µg/l)
Chromium	12	25	1	6.2

The following constituents exhibited normally distributed background data with less than 25% non-detects. One sided parametric prediction intervals were computed on the background data for all of these constituents. The UPLs for these constituents were set as their respective BTLs, with one exception. For pH, a two-sided parametric prediction interval was computed; therefore, the BTL for pH consisted of a range between the lower prediction limit (LPL) and the upper prediction limit. The background concentration calculations were based on a site wide 95% confidence, 95% coverage upper prediction intervals. When adjusted for multiple comparisons of the background data, the minimum required false positive rate was below 1% (0.01). A 99% confidence level (0.01 false positive rate) was used for all individual comparisons, which with the most conservative assumptions provided a site-wide false positive rate of >0.05 for all constituents. The background and relevant statistical data for these constituents are summarized below. The prediction interval computations for these constituents are presented in Appendix C.

BTL = UPL of one-sided Prediction Interval (exception pH) w/site-wide false positive rate>0.05 (individual comparisons false positive rate=0.01) BTL for pH = LPL - UPL of two-sided Prediction Interval				
Parameter	Sample Size	% Non-Detects	DL (µg/l)	BTL (µg/l)
Barium	12	0	2	175.4
Dichlorodifluoromethane	12	8	0.3	46.5
Tetrachloroethene	12	17	0.1	0.7
TOX	12	17	5	42.2

BTL = UPL of one-sided Prediction Interval (exception pH) w/site-wide false positive rate>0.05 (individual comparisons false positive rate=0.01) BTL for pH = LPL - UPL of two-sided Prediction Interval				
Parameter	Sample Size	% Non-Detects	DL ( $\mu\text{g/l}$ )	BTL ( $\mu\text{g/l}$ )
Trichlorofluoromethane	12	0	0.5	11.3
Specific Conductivity	8	0	1 $\mu\text{S/cm}$	672 $\mu\text{S/cm}$
pH	8	0	0.1 pH units	5.7 to 7.9 pH units

### 3.5.2 Results of Statistical Comparisons

The following table lists the constituents which were detected during the Fourth Quarter 1998 event at concentrations exceeding their respective background threshold levels (BTLs), and the downgradient wells in which they were detected.

Parameter	Monitoring Well(s)
Arsenic	16-5, 16WC2B
Barium	16-2, 16-3, 16-5, 16WC1A, 16WC1B, 16WC2B, 16SPRING
Beryllium	16WC1B, 16WC2B
Cadmium	16WC1B
Chromium	16-3, 16-5, 16WC1B, 16WC2B
Cobalt	16-5, 16WC1B, 16WC2B
Copper	16-5, 16WC1B, 16WC2B
Lead	16WC1B
Mercury	16WC1B
Nickel	16-5, 16WC1A, 16WC2B
Selenium	16-5, 16WC1B, 16WC2B
Zinc	16WC1B
2,4-Dinitrotoluene	16-3, 16-5, 16WC1B, 16WC2B, 16SPRING
2,6-Dinitrotoluene	16WC1A, 16WC1B

Any HWMU-16 target constituents not listed above were not detected in the downgradient monitoring wells at concentrations exceeding their respective BTLs.

### 3.6 HWMU-16 PLUME DELINEATIONS

In accordance with VDEQ instructions presented during the May 19, 1999 meeting between Alliant and the VDEQ, Isoconcentration Maps were produced to depict constituent plumes in the groundwater beneath the site (Appendix A). In order to evaluate the shape and position of constituent plumes over time, historical Isoconcentration Maps were developed using the historical maximum concentrations for the constituents monitored at the site for the time periods of 1992 through 1995 and 1996 through 1998. The historical maximum concentrations for these time periods are listed in Tables 3 and 4, respectively (Appendix B).

Groundwater analytical data collected prior to 1992 were not included in the evaluation of historical maximum concentrations. The data collected prior to 1992 are considered unreliable due to "order-of-magnitude" variations in parameter concentrations from quarter to quarter, as well as a general lack of laboratory QA/QC. Additionally, the groundwater monitoring analyte lists prior to 1992 did not include many of the parameters on the current groundwater monitoring analyte list for HWMU-16.

**TABLE 2**

**HWMU-5:** The additional Appendix IX constituents detected in the downgradient point of compliance wells were not detected above their respective Quantitation Limits (QLs) in the upgradient well. As a result, background concentrations for those constituents were set as equal to their respective QLs. In accordance with the Permit (Condition V.J.1.g.), GPS are proposed for those additional Appendix IX constituents that are listed in Appendix VIII of 40 CFR Part 261 (chromium, 4-nitroaniline, nitrobenzene, and dichlorodifluoromethane). No GPS are proposed for the additional Appendix IX constituents that are not listed in Appendix VIII of 40 CFR Part 261 (diethyl ether and 2-nitroaniline).

**HWMU-7:** Background concentrations for the additional Appendix IX constituents detected in the downgradient point of compliance wells (copper and zinc) were previously calculated and submitted to the VDEQ in the August 1998 *Groundwater Quality Assessment Report for HWMU-7* prepared by ERM, Inc. In accordance with the Permit (Condition V.J.2.g.), no GPS are proposed for the additional Appendix IX constituents (copper and zinc), as they are not listed in Appendix VIII of 40 CFR Part 261.

**HWMU-10:** The additional Appendix IX constituents detected in the downgradient point of compliance wells were not detected above their respective Quantitation Limits (QLs) in the upgradient well. As a result, background concentrations for those constituents were set as equal to their respective QLs. In accordance with the Permit (Condition V.J.3.g.), no GPS are proposed for the additional Appendix IX constituents (cobalt, vanadium, acetone, and 2-propanol), as they are not listed in Appendix VIII of 40 CFR Part 261.

**HWMU-16:** Background concentrations for additional Appendix IX constituents chloroethane, diethyl ether, dimethyl ether, and methylene chloride were calculated using data collected from upgradient well 16C1 during the period from Third Quarter 2003 through Third Quarter 2004. The background concentration for additional Appendix IX constituent 1,1,2-trichloro-1,2,2-trifluoroethane was calculated using data collected from upgradient well 16C1 during the period from Second Quarter 2004 through Third Quarter 2006. In accordance with the Permit (Condition V.J.4.g.), GPS are proposed for additional Appendix IX constituents that are listed in Appendix VIII of 40 CFR Part 261 (chloroethane). No GPS are proposed for the additional Appendix IX constituents that are not listed in Appendix VIII of 40 CFR Part 261 (diethyl ether and dimethyl ether).

\*Methylene chloride and 1,1,2-trichloro-1,2,2-trifluoroethane should not be added to the Groundwater Monitoring List for HWMU-16, as these constituents were only detected in the upgradient well for the Unit, and not in the downgradient point of compliance wells.

## **Statistical Computations – RAAP HWMU-16 – 1,1,2-Trichloro-1,2,2-Trifluoroethane**

In accordance with the facility permit and VHWMR, statistical background concentration is being established for 1,1,1-Trichloro-1,2,2-Trifluoroethane. Inter-well upper prediction limits (UPL) were calculated on the background data for this target parameter in accordance with the facility permit and VHWMR (40 CFR 264.97(h)). Background data for this target parameter consisted of all data for the background well 16C1 collected from 2<sup>nd</sup> quarter 2004 through 3<sup>rd</sup> quarter 2006.

### *Discussion of Tests for Normality*

The power of a statistical tool to account for false positive and false negative results, while accurately detecting true statistical variations for a facility under scrutiny depends on numerous factors, one of which is the distribution of the data. A great number of statistical tools are based on the assumption that data are normally distributed. Hence the distribution of the sample population for parameters evaluated under this statistical analysis is first determined. Sample populations are tested for normal distribution using several normality tests. "Groundwater Information Tracking System with Statistical Analysis Capability" (GRITS/STAT) v5.0 was the software used to run these statistical tests. GRITS/STAT is an analytical software package provided by the USEPA. The distributions of the data sets were verified in the original mode as well as in log-transformed mode. The normality of the data set was evaluated using the Shapiro-Wilk test for normality.

### *Discussion of Prediction Interval Tests*

Normality tests are performed prior to running parametric tests (tests that require that the data be normal). Results of the normality tests show that the background data for 1,1,2-Trichloro-1,2,2-Trifluoroethane is non-normally distributed. Non-parametric UPL (NUPL) was constructed on the background data for this parameter. The confidence levels of NUPLs are typically approximate and estimated to be around 91%.

### *Summary of UPL*

<b>Parameter</b>	<b>Background Data Distribution</b>	<b>Type of UPL</b>	<b>Multiple Comparisons/year</b>	<b>UPL (µg/l)</b>
1,1,2-Trichloro-1,2,2-Trifluoroethane	Non-Normal	NUPL	N/A	1.2

## Statistical Computations – RAAP HWMU-16

In accordance with the facility permit and VHWMR, statistical background concentrations are being established for the four new target parameters chloroethane, diethyl ether, dimethyl ether and methylene chloride. These four target parameters were added to the facility monitoring program during the 3<sup>rd</sup> quarter 2003 monitoring event. Inter-well upper prediction limits (UPL) were calculated on the background data for the target parameters in accordance with the facility permit and VHWMR (40 CFR 264.97(h)). Background data for these target parameters consisted of all data for the background well 16C1 collected from 3<sup>rd</sup> quarter 2003 through 3<sup>rd</sup> quarter 2004.

### *Discussion of Tests for Normality*

The power of a statistical tool to account for false positive and false negative results, while accurately detecting true statistical variations for a facility under scrutiny depends on numerous factors, one of which is the distribution of the data. A great number of statistical tools are based on the assumption that data are normally distributed. Hence the distribution of the sample population for parameters evaluated under this statistical analysis is first determined. Sample populations were tested for normal distribution using several normality tests. "Groundwater Information Tracking System with Statistical Analysis Capability" (GRITS/STAT) v5.0 was the software used to run these statistical tests. GRITS/STAT is an analytical software package provided by the USEPA. The distributions of the data sets were verified in the original mode as well as in log-transformed mode. The normality of the data sets was evaluated using the Shapiro-Wilk test for normality.

### *Discussion of Prediction Interval Tests*

Normality tests are performed prior to running parametric tests (tests that require that the data be normal). A 99% confidence parametric inter-well UPL was computed for each of the four target parameters that showed normally distributed background data. Results of the normality tests show that the background data for chloroethane, diethyl ether and methylene chloride are normally distributed, and the background data for dimethyl ether is non-normally distributed. Non-parametric UPL (NUPL) was constructed on the background data for dimethyl ether, and parametric UPLs (PUPL) were constructed on the background data for chloroethane, diethyl ether and methylene chloride. No adjustments to the error rates were made to the NUPLs for multiple comparisons. Adjustment for 10 comparisons per year (considering 10 compliance monitoring wells at the facility and 4 quarters of data for each year, and considering historic detects, 10 is considered a representative number for multiple comparisons per year) was made to the PUPLs. The confidence levels of NUPLs are well less than 95%. Any statistically significant increase (SSI) must be confirmed by verification sampling.

*Summary of UPLs*

<b>Parameter</b>	<b>Background Data Distribution</b>	<b>Type of UPL</b>	<b>Multiple Comparisons/year</b>	<b>UPL (µg/l)</b>
Chloroethane	Normal	PUPL	10	20.7
Diethyl ether	Normal	NUPL	10	75.5
Dimethyl ether	Non-normal	PUPL	N/A	17.0
Methylene Chloride	Normal	PUPL	10	13.95

## RAAP-HWMU-16 - Statistical Analysis - Notes

1) Y2K Correction dates are as shown in table below.

Actual Event	Date Used in Stat Software
2000-Qtr1	12/13/1999
2000-Qtr2	12/14/1999
2000-Qtr3	12/15/1999
2000-Qtr4	12/16/1999
2001-Qtr1	12/17/1999
2003-Qtr3	12/18/1999
2003-Qtr4	12/19/1999
2004-Qtr1	12/20/1999
2004-Qtr2	12/21/1999
2004-Qtr3	12/22/1999

### Interwell Tests:

2) Background data for target parameters chloroethane, diethyl ether, dimethyl ether and methylene chloride were evaluated using Shapiro-Wilk test. Background data showed normal distribution for chloroethane, diethyl ether and methylene chloride. Parametric interwell 99% confidence upper prediction limits were computed for parameters with normally distributed background data. Dimethyl ether background data was non-normally distributed. Therefore non-parametric Upper Prediction Limit (UPL) was computed for dimethyl ether.

3) No adjustments for multiple comparisons could be made for non-parametric UPLs. Adjustments were made to the parametric UPLs for 10 future comparisons per year to account for multiple compliance monitoring wells and quarterly event data. Any Statistically significant increase (SSI) must be confirmed by verification sampling.

# **Target Analyte Monitoring Results - HWMU-16 Point of Compliance Wells** **Radford Army Ammunition Plant, Radford, Virginia**

Upgradient well = 16C1

All Results in ug/L.

Analyte/Quarter	16C1	16MW8	16MW9	16WC1A	16WC1B	OL	GPS	Method
-----------------	------	-------	-------	--------	--------	----	-----	--------

**Definitions:** QL Denotes permit required quantitation limit. U Denotes analyte not detected at or above QL. UA Denotes analyte not detected at or above adjusted sample QL. J Denotes associated result is estimated. When used with "U" (i.e., "UJ"), denotes analyte not detected at or above QL and QL is estimated. When used with "UA" (i.e., "UAJ"), denotes analyte not detected at or above adjusted QL and adjusted QL is estimated. UN Denotes analyte concentration is less than the quantitation limit and five times the blank concentration. Not reliably detected due to blank contamination. This qualifier used only for Appendix IX monitoring event when results are reported to at or above the project detection limit. R Denotes result rejected. Q Denotes data validation qualifier. CAS# Denotes Chemical Abstract Services registration number. X Denotes mass spectral confirmation not obtained-result suspect.

**GPS** Denotes Groundwater Protection Standards listed in Appendix G to Attachment 5 in the Final Hazardous Waste Post-Closure Care Permit for Hazardous Waste Units 5, 7, 10, and 16 (October 4, 2002).

**NS** denotes not sampled. **NA** denotes not analyzed. "—" denotes not detected (pre-2nd Quarter 2003) or not available / not sampled (beginning 2nd Quarter 2003).

## **Notes:**

### **-Appendix IX Groundwater Monitoring Events:**

Third Quarter 2003, Second Quarter 2004, Second Quarter 2005, Third Quarter 2006, Second Quarter 2007

For Appendix IX monitoring events, all results evaluated to detection limit. See laboratory data deliverable for detection limit.

-9/30/2003: Verification sampling event for 16C1 (heptachlor) and 16C1B (Endrin). Verification results: all results reported not detected to detection limit. Original results 0.067 µg/l and 0.39 µg/l, respectively. Confirmation results reported in this table.

-9/30/2003: Verification sampling event for 16C1 (chloroethane, ethyl ether, methyl ether, methylene chloride) and 16MW9 (chloroethane, ethyl ether, methyl ether). Verification results: all results confirmed original analysis. Original results reported in this table.

-June 21, 2004: Verification event for 8260B 16C1 (1,1-dichloroethene and 1,1,2-trichloro-1,2,2-trifluoroethane).

Verification results: all not detected except 1,1,2-trichloro-1,2,2-trifluoroethane added to quarterly analyte list beginning 3Q 2004.

Due to laboratory error, Appendix IX results for semivolatiles (Method 8270C) will be presented in 3Q 2004. Verification event results for 16WC1B and 16C1 (8081A) — all verification results were not confirmed.

-07/27-28/2005. Verification event for 16WC1B (Mercury Method 7470A.) Not detected in verification sample.

Also, verification event for 16C1, 16WC1B-8081A. and 16C1, 16MW9, 16WC1A-ethanol. All verification results not detected. Verification results used.

-06/19/2007. Verification event for 16WC1B and 16MW9 thallium Not detected in verification sample. Verification results used.
